Problem 1

Since \( f \) is continuous on the closed interval \([a, b]\), by the Extreme Value Theorem, the function \( f \) takes on a maximum value \( M \) and a minimum value \( N \) on \([a, b]\). Then

\[
(b - a)N \leq \int_a^b f(x) \, dx \leq (b - a)M
\]

so

\[
N \leq \frac{1}{b - a} \int_a^b f(x) \, dx \leq M
\]

By the Intermediate Value Theorem, there must exist a value of \( c \) with \( a \leq c \leq b \) such that

\[
f(c) = \frac{1}{b - a} \int_a^b f(x) \, dx. \tag{1}
\]

Note: I can make a reference to a labeled thing like equation \([1]\) with \( \texttt{eqref} \), or I can do it like with \( \texttt{autoref} \) to get \textit{Equation 1}. Here’s a QED tombstone to mark the end of my solution.

Problem 2

I can reference another problem like this: See \texttt{Problem 3 b} or \texttt{Problem 1}.

Problem 3

3 a

The Ackermann function is

\[
A(m, n) := \begin{cases} n + 1 & \text{if } m = 0 \\ A(m - 1, 1) & \text{if } m > 0 \text{ and } n = 0 \\ A(m - 1, A(m, n - 1)) & \text{if } m > 0 \text{ and } n > 0 \end{cases}
\]

3 b

This is how you do an aligned equation environment:

\[
d(f, h) = \int_a^b |f(x) - h(x)| \, dx \\
= \int_a^b |f(x) - g(x) + g(x) - h(x)| \, dx \\
\leq \int_a^b (|f(x) - g(x)| + |g(x) - h(x)|) \, dx \\
= \int_a^b |f(x) - g(x)| \, dx + \int_a^b |g(x) - h(x)| \, dx \\
= d([f], [g]) + d([g], [h])
\]

\[\square\]
or you can do this to suppress numberings for specific lines

\[
d(f, h) = \int_{a}^{b} |f(x) - h(x)| \, dx \\
= \int_{a}^{b} |f(x) - g(x) + g(x) - h(x)| \, dx \\
\leq \int_{a}^{b} (|f(x) - g(x)| + |g(x) - h(x)|) \, dx \\
= \int_{a}^{b} |f(x) - g(x)| \, dx + \int_{a}^{b} |g(x) - h(x)| \, dx \\
= d([f], [g]) + d([g], [h])
\]

(2)

so you can have a reference to just (2).

\[\square\]

Problem 4

4 a

Follow the link to find out more about source code formatting.

```java
for (int n : new int[]{17, 34, 51, 68, 85}) {
    System.out.println(n);
}
```
