6.5 Reductions

- introduction
- designing algorithms
- establishing lower bounds
- classifying problems
Overview

Main topics.
• Reduction: relationship between two problems.
• Algorithm design: paradigms for solving problems.

Shifting gears.
• From individual problems to problem-solving models.
• From linear/quadratic to polynomial/exponential scale.
• From implementation details to conceptual frameworks.

Goals.
• Place algorithms and techniques we've studied in a larger context.
• Introduce you to important and essential ideas.
• Inspire you to learn more about algorithms!
6.5 Reductions

- Introduction
- Designing algorithms
- Establishing lower bounds
- Classifying problems
Bird's-eye view

Goal. Classify problems according to computational requirements.

<table>
<thead>
<tr>

</table>

Frustrating news. Huge number of problems have defied classification.
Bird's-eye view

Goal. Classify problems according to computational requirements.

Goal. Suppose we could (could not) solve problem $X$ efficiently. What else could (could not) we solve efficiently?

“Give me a lever long enough and a fulcrum on which to place it, and I shall move the world.” — Archimedes
**Reduction**

**Def.** Problem $X$ reduces to problem $Y$ if you can use an algorithm that solves $Y$ to help solve $X$.

\[
\text{Cost of solving } X = \text{total cost of solving } Y + \text{cost of reduction}.
\]

- Perhaps many calls to $Y$ on problems of different sizes (typically only 1 call)
- Preprocessing and postprocessing (typically less than cost of solving $Y$)
**Reduction**

**Def.** Problem $X$ reduces to problem $Y$ if you can use an algorithm that solves $Y$ to help solve $X$.

---

**Ex 1.** [finding the median reduces to sorting]

To find the median of $N$ items:
- Sort $N$ items.
- Return item in the middle.

**Cost of finding the median.** $N \log N + 1$. 
**Def.** Problem \( X \) reduces to problem \( Y \) if you can use an algorithm that solves \( Y \) to help solve \( X \).

**Ex 2.** [element distinctness reduces to sorting]

To solve element distinctness on \( N \) items:

- Sort \( N \) items.
- Check adjacent pairs for equality.

Cost of element distinctness. \( N \log N + N \).
6.5 Reductions

- introduction
- designing algorithms
- establishing lower bounds
- classifying problems
Reduction: design algorithms

**Def.** Problem $X$ reduces to problem $Y$ if you can use an algorithm that solves $Y$ to help solve $X$.

**Design algorithm.** Given an algorithm for $Y$, can also solve $X$.

**Example reductions.**
- Finding the median reduces to sorting
- Element distinctness reduces to sorting
- Arbitrage reduces to negative cycles.
- Seam carving reduces to shortest paths in a DAG.

**Mentality.** Since I know how to solve $Y$, can I use that algorithm to solve $X$?

programmer's version: I have code for $Y$. Can I use it for $X$?
Convex hull reduces to sorting

**Sorting.** Given $N$ distinct integers, rearrange them in ascending order.

**Convex hull.** Given $N$ points in the plane, identify the extreme points of the convex hull (in counterclockwise order).

![Diagram of convex hull and points](image)

<table>
<thead>
<tr>
<th>Convex hull</th>
<th>Sorting</th>
</tr>
</thead>
<tbody>
<tr>
<td>1251432</td>
<td>1</td>
</tr>
<tr>
<td>2861534</td>
<td>2</td>
</tr>
<tr>

<tr>
<td>43434213</td>
<td>7</td>
</tr>
<tr>
<td>34435312</td>
<td>8</td>
</tr>
</tbody>
</table>

**Proposition.** Convex hull reduces to sorting.

**Pf.** Graham scan algorithm.

**Cost of convex hull.** $N \log N + N$. 

---

*Note: The image contains a table showing the points and their associated numbers, illustrating the relationship between convex hull and sorting.*
Graham scan algorithm

Graham scan.

- Choose point \( p \) with smallest (or largest) \( y \)-coordinate.
- **Sort** points by polar angle with \( p \) to get simple polygon.
- Consider points in order, and discard those that would create a clockwise turn.
Proposition. Undirected shortest paths (with nonnegative weights) reduces to directed shortest path.

Pf. Replace each undirected edge by two directed edges.

Cost of solving undirected shortest paths. $E \log V + (E + V)$. 

\[
E \log V + (E + V) 
\]
Some reductions in combinatorial optimization

undirected shortest paths (nonnegative)

directed shortest paths (nonnegative)

arbitrage

shortest paths (in a DAG)

directed shortest paths (no neg cycles)

seam carving
6.5 Reductions

- introduction
- designing algorithms
- establishing lower bounds
- classifying problems
**Goal.** Prove that a problem requires a certain number of steps.

**Ex.** In decision tree model, any compare-based sorting algorithm requires $\Omega(N \log N)$ compares in the worst case.

**Bad news.** Very difficult to establish lower bounds from scratch.

**Good news.** Spread $\Omega(N \log N)$ lower bound to $Y$ by reducing sorting to $Y$.
Linear-time reductions

Def. Problem $X$ linear-time reduces to problem $Y$ if $X$ can be solved with:
- Linear number of standard computational steps.
- Constant number of calls to $Y$.

Establish lower bound:
- If $X$ takes $\Omega(N \log N)$ steps, then so does $Y$.
- If $X$ takes $\Omega(N^2)$ steps, then so does $Y$.

Mentality.
- If I could easily solve $Y$, then I could easily solve $X$.
- I can’t easily solve $X$.
- Therefore, I can't easily solve $Y$. 
Lower bound for convex hull

**Proposition.** In quadratic decision tree model, any algorithm for sorting \( N \) integers requires \( \Omega(N \log N) \) steps.

\[
\text{allows linear or quadratic tests: } \quad x_i < x_j \text{ or } (x_j - x_i)(x_k - x_i) - (x_i)(x_j - x_i) < 0
\]

**Proposition.** Sorting linear-time reduces to convex hull.

**Pf.** [see next slide]

**Implication.** Any counterclockwise-based convex hull algorithm requires \( \Omega(N \log N) \) ops.
Proposition. Sorting linear-time reduces to convex hull.

- Sorting instance: \( x_1, x_2, \ldots, x_N \).
- Convex hull instance: \((x_1, x_1^2), (x_2, x_2^2), \ldots, (x_N, x_N^2)\).

\[ f(x) = x^2 \]

Pf.

- Region \( \{ x : x^2 \geq x \} \) is convex \( \Rightarrow \) all \( N \) points are on hull.
- Starting at point with most negative \( x \), counterclockwise order of hull points yields integers in ascending order.
Establishing lower bounds: summary

Establishing lower bounds through reduction is an important tool in guiding algorithm design efforts.

Q. How to convince yourself no linear-time convex hull algorithm exists?
A2. [easy way] Linear-time reduction from sorting.
6.5 Reductions

- introduction
- designing algorithms
- establishing lower bounds
- classifying problems
Classifying problems: summary

**Goal.** Problem with algorithm that matches lower bound.

**Ex.** Sorting and element distinctness have complexity $N \log N$.

**Goal’.** Prove that two problems $X$ and $Y$ have the same complexity.
- First, show that problem $X$ linear-time reduces to $Y$.
- Second, show that $Y$ linear-time reduces to $X$.
- Conclude that $X$ and $Y$ have the same complexity.

even if we don't know what it is!

$X = \text{sorting}$

$Y = \text{convex hull}$

In one case, reducing convex hull to sorting, gave us a lower bound

In the other case, reducing convex hull to sorting gave us a useful algorithm

Together they are useful because it helps to classify the problems.
Integer arithmetic reductions

**Integer multiplication.** Given two $N$-bit integers, compute their product.

**Brute force.** $N^2$ bit operations.
**Integer arithmetic reductions**

**Integer multiplication.** Given two $N$-bit integers, compute their product.

**Brute force.** $N^2$ bit operations.

Good news. Can put many problems into equivalence classes.
Complexity zoo

Complexity class. Set of problems sharing some computational property.

Bad news. Lots of complexity classes (496 animals in zoo).
Summary

Reductions are important in theory to:

- Design algorithms.
- Establish lower bounds.
- Classify problems according to their computational requirements.

Reductions are important in practice to:

- Design algorithms.
- Design reusable software modules.
  - stacks, queues, priority queues, symbol tables, sets, graphs
  - sorting, regular expressions, suffix arrays
  - MST, shortest paths, maxflow, linear programming
- Determine difficulty of your problem and choose the right tool.
