1. (12 points) Multiple Choice — Coq Programming
Circle the correct answer. (Each question has one unique correct answer.)

(a) What is the type of the Coq term: \( (\text{fun } \text{n:nat} \Rightarrow n = 0) \)?
   i. \( \text{nat} \rightarrow \text{nat} \)
   ii. \( \text{Prop} \)
   iii. \( \text{nat} \rightarrow \text{Prop} \)
   iv. \( \text{forall } n: \text{nat}, n = 0 \)
   v. ill typed

(b) What is the type of the Coq term: \( (\text{forall } n: \text{nat}, n = 0) \)?
   i. \( \text{nat} \rightarrow \text{nat} \)
   ii. \( \text{Prop} \)
   iii. \( \text{nat} \rightarrow \text{Prop} \)
   iv. \( \text{forall } n: \text{nat}, n = 0 \)
   v. ill typed

(c) What is the type of the Coq term: \( (\text{fun } (\text{P:nat} \rightarrow \text{Prop}) \ (\text{n:nat}) \ (Q:\text{P n}) \Rightarrow Q) \)?
   i. \( \text{nat} \rightarrow \text{Prop} \rightarrow \text{nat} \rightarrow \text{Prop} \rightarrow \text{Prop} \)
   ii. \( \text{forall } (\text{P : nat} \rightarrow \text{Prop}), \text{nat} \rightarrow \text{Prop} \)
   iii. \( (\text{nat} \rightarrow \text{Prop}) \rightarrow (\text{n:nat} \rightarrow \text{P n}) \rightarrow \text{Q} \)
   iv. \( \text{forall } (\text{P : nat} \rightarrow \text{Prop}) \ (\text{n : nat}), \text{P n} \rightarrow \text{P n} \)
   v. ill typed

(d) What is the type of the Coq term: \( ((\text{fun } \text{P:Prop} \Rightarrow \text{P}) \ (3 = 4)) \)
   i. \( \text{Prop} \)
   ii. \( \text{nat} \)
   iii. \( \text{nat} \rightarrow \text{Prop} \)
   iv. \( \text{Prop} \rightarrow \text{nat} \)
   v. ill typed
2. (16 points) Multiple Choice — Imp Equivalence
Circle all correct answers. There may be zero or more than one. For reference, the definition of Imp, its evaluation semantics, and program equivalence (cequiv) start on page 14.

(a) Consider the Imp program:

```plaintext
IF X > 0 THEN
    WHILE X > 0 DO SKIP END
ELSE
    SKIP
FI
```

Which of the following are equivalent to it, according to cequiv?

i. WHILE X > 0 DO  
   ii. SKIP  
   iii. X ::= 0  
   iv. IF X > 1 THEN  
   END  
   ELSE  
   WHILE X > 0 DO SKIP END

(b) Consider the Imp program:

```plaintext
X ::= 0;;
Y ::= X + 1;;
```

Which of the following are equivalent to it, according to cequiv?

i. Y ::= 1;;  
ii. Y ::= 0;;  
iii. Y ::= 1;;  
iv. Y ::= 2;;
X ::= 0;;  
X ::= Y + 1;;
```

(c) Consider an arbitrary Imp command c. Which of the following are equivalent to c, according to cequiv?

i. c ;; c  
ii. X := 1;;  
iii. IF X > 0 THEN  
    WHILE X > 0 DO c SKIP END  
    ELSE  
    c ; X ::= X - 1

(d) Which of the following propositions are provable?

i. forall c, (exists st:state, c / st || st) -> cequiv c SKIP
ii. forall c1 c2 st1 s3,
    ((c1 ;; c2) / st1 || st3) -> (exists st2:state, c1 / st1 || st2 /\ c2 / st2 || st3).
iii. forall c1 c2, (cequiv c1 c2) -> (cequiv (c1;;c2) (c2;;c1))
iv. forall c, (forall st, c / st || st) -> cequiv c SKIP.
3. (16 points) Hoare Logic
The following Imp program computes \( m \times n \), placing the answer into \( Z \).

\[
\begin{align*}
\{ \text{True} \} \\
X &::= 0 ; ; \\
Z &::= 0 ; ; \\
\text{WHILE } X \not= n \text{ DO} \\
\quad Y &::= 0 ; ; \\
\quad \text{WHILE } Y \not= m \text{ DO} \\
\quad \quad Z &::= Z + 1 ; ; \\
\quad \quad Y &::= Y + 1 ; ; \\
\quad \text{END} \\
\quad X &::= X + 1 ; ; \\
\text{END} \\
\{ Z = m \times n \} 
\end{align*}
\]

On the next page, add appropriate annotations to the program in the provided spaces to show that the Hoare triple given by the outermost pre- and post-conditions is valid. Use informal notations for mathematical formulae and assertions, but please be completely precise and pedantic in the way you apply the Hoare rules — i.e., write out assertions in exactly the form given by the rules (rather than logically equivalent ones). The provided blanks have been constructed so that, if you work backwards from the end of the program, you should only need to use the rule of consequence in the places indicated with \( \rightarrow \rightarrow \).

The Hoare rules and the rules for well-formed decorated programs are provided on pages 16 and 17, for reference.
Mark the implication step(s) in your decoration (by circling the \(\rightarrow\)) that rely on the following fact. You may use other arithmetic facts silently.

- \(m \times a + m = m \times (a + 1)\)

\[
\begin{align*}
\{ \text{True} \} & \quad \rightarrow \quad \\
X & := 0; \\
\{ \} & \\
Z & := 0; \\
\{ \} & \\
\text{WHILE } X \neq n \text{ DO} & \\
\{ \} & \quad \rightarrow \quad \\
\{ \} & \\
Y & := 0; \\
\{ \} & \\
\text{WHILE } Y \neq m \text{ DO} & \\
\{ \} & \quad \rightarrow \quad \\
\{ \} & \\
Z & := Z + 1; \\
\{ \} & \\
Y & := Y + 1; \\
\{ \} & \\
\text{END} & \\
\{ \} & \quad \rightarrow \quad \\
\{ \} & \\
X & := X + 1; \\
\{ \} & \\
\text{END} & \\
\{ \} & \quad \rightarrow \quad \\
\{ \text{Z = m \times n } \}
\end{align*}
\]
4. (16 points) Inductive Definitions and Scoping

Consider the following Coq definitions for a simple language of arithmetic expressions with constants, variables, plus, and let.

Definition id := nat.
Inductive tm : Type :=
| tnum : nat -> tm (* Constants 0, 1, 2, ... *)
| tvar : id -> tm (* Variables X Y Z ... *)
| tplus : tm -> tm -> tm (* Plus: t1 + t2 *)
| tlet : id -> tm -> tm -> tm. (* Let: let X = t1 in t2 *)

The let construct follows the usual variable scoping rules. That is, in let X = t1 in t2, written in Coq as (tlet X t1 t2), the variable X is bound in t2.

Recall that a variable X appears free in a term t if there is an occurrence of X that is not bound by a corresponding let. Complete the following Coq definition of afi as an inductively defined relation such that afi X t is provable if and only if X appears free in t.

Inductive afi : id -> tm -> Prop :=
5. (20 points) Informal Proofs — Substitution

Your job in this problem is to prove a substitution lemma. First, we extend the let language from the previous problem by adding a unit constant. Informally, the grammar of the terms and types for the resulting language is given by:

\[
\begin{align*}
t & ::= (\ast \text{ Terms } \ast) \\
| ~() & (\ast \text{ Unit constant } \ast) \\
| ~n & (\ast \text{ Natural numbers } \ast) \\
| ~X & (\ast \text{ Variables } \ast) \\
| ~t + t & (\ast \text{ Sum } \ast) \\
| \text{let } X = t \text{ in } t & (\ast \text{ Let } \ast)
\end{align*}
\]

\[
\begin{align*}
T & ::= (\ast \text{ Types } \ast) \\
| \text{ Unit} \\
| \text{ Nat} \\
| X \\
| t + t \\
| \text{let } X = t \text{ in } t
\end{align*}
\]

The type system is given by:

\[
\begin{align*}
\Gamma & \vdash X \in T \\
\Gamma & \vdash n \in \text{Nat} \\
\Gamma & \vdash () \in \text{Unit}
\end{align*}
\]

\[
\begin{align*}
\Gamma & \vdash t_1 \in \text{Nat} \\
\Gamma & \vdash t_2 \in \text{Nat} \\
\Gamma & \vdash t_1 \in \text{T}_1 \\
\Gamma, X : T & \vdash t_1 \in \text{T}_2 \\
\Gamma & \vdash t_1 + t_2 \in \text{Nat} \\
\Gamma & \vdash \text{let } X = t_1 \text{ in } t_2 \in \text{T}_2
\end{align*}
\]

The substitution operation is defined by:

\[
\begin{align*}
[X:=s]() & = () \\
[X:=s]n & = n \\
[X:=s]X & = s \\
[X:=s]Y & = Y \quad \text{(if } X \neq Y) \\
[X:=s](t_1 + t_2) & = ([X:=s]t_1 + [X:=s]t_2) \\
[X:=s](\text{let } X = t_1 \text{ in } t_2) & = (\text{let } X = [X:=s]t_1 \text{ in } t_2) \\
[X:=s](\text{let } Y = t_1 \text{ in } t_2) & = (\text{let } Y = [X:=s]t_1 \text{ in } [X:=s]t_2) \quad \text{(if } x \neq Y)
\end{align*}
\]

Also recall the following lemma, which makes use of the concept of “appears free in” from the previous problem. You do not need to prove this lemma.

**Lemma:** Context Invariance

Suppose \( \Gamma \vdash t \in T \) and that, for all \( X \), if \( X \) appears free in \( t \) then \( \Gamma' X = \Gamma X \). Then \( \Gamma' \vdash t \in T \).
Give a careful, informal proof of the substitution lemma for this language. You may freely use functional extensionality to reason about context equivalence, and you may find it helpful to invoke the context invariance lemma at some point(s).

**Lemma:** Substitution Preserves Typing

For all $t$, $v$, $X$, $\Gamma$, $T$, and $U$, if $\Gamma, X:U \vdash t \in T$ and $\vdash v \in U$ then $\Gamma \vdash [X:=v]t \in T$. 
6. (20 points) STLC with Natural Number Induction

In this problem we will develop a variant of the simply-typed lambda calculus with natural numbers and an induction operator. The starting point is the plain simply typed lambda with a base type of natural numbers and constructors for the constant zero $0$ and successor $S$.

You can find the syntax, typing rules, and small-step evaluation rules for this part of the language beginning on page 19. Note: for this problem we do not consider STLC with subtyping, fix, or other extensions.

(a) Recall that we can draw typing derivations as “trees” where each node is a judgment of the form $\Gamma \vdash t \in T$. The root of the tree (pictured at the bottom of the drawing) is the desired conclusion, and each premise is a subtree that instantiates a typing rule. For example, the following is a legal typing derivation:

```
-------------------- T_Zero
x:Nat \vdash 0 \in Nat
-------------------- T_Succ
x:Nat \vdash S 0 \in Nat
----------------------------- T_Abs
\vdash \x:Nat. (S 0) \in Nat \rightarrow Nat
```

Complete the typing derivation given below. Label the inference rule used at each node of the tree. Note that the type of the root judgment needs to be filled in.

```
------------------------------------------------------------ (T_Abs)
\vdash x:Nat \vdash \y:(Nat \rightarrow Nat). S (y (S x)) \in
```
Rather than adding `if0` and the general recursion operator `fix`, here we follow Coq and add a built-in form of natural-number induction.

\[
\begin{array}{l}
t ::= \ldots \\
| \text{naturale} \quad t \\
\end{array}
\]

The term `nat_ind tz ts tn` acts like a fold over the natural number datatype. The term `tz` specifies what to do for the base (zero) case of the induction, and the term `ts` (successor) shows how to compute the answer for `S n` given `n` itself and the inductive result for `n`. The argument `tn` is the natural number over which induction is being done.

Once we have added `nat_ind` to the STLC, we can write many familiar programs using natural numbers. For example, here is a function that adds two natural numbers, defined by induction on `n`. The base case is just `m` and the inductive step computes the successor of the recursive result:

\[
(* \text{Nat_plus} *) \quad \lambda n:\text{Nat}. \quad \lambda m:\text{Nat}. \quad \text{nat_ind} \quad m \quad (\lambda x:\text{Nat}. \lambda y:\text{Nat}. S \; y) \quad n
\]

The steps it takes when computing `Nat_plus 2 1` look like this, where we have marked the novel behavior of `nat_ind` with `!!`:

\[
\begin{align*}
(\lambda n:\text{Nat}. \quad \lambda m:\text{Nat}. \quad \text{nat_ind} \quad m \quad (\lambda x:\text{Nat}. \lambda y:\text{Nat}. S \; y) \quad n) \quad (S \; S \; 0) \quad (S \; 0) \\
&\Rightarrow (\lambda m:\text{Nat}. \quad \text{nat_ind} \quad m \quad (\lambda x:\text{Nat}. \lambda y:\text{Nat}. S \; y) \quad (S \; S \; 0)) \quad (S \; 0) \\
&\Rightarrow \text{nat_ind} \quad (S \; 0) \quad (\lambda x:\text{Nat}. \lambda y:\text{Nat}. S \; y) \quad (S \; S \; 0) \\
&\Rightarrow \quad !! \quad \text{inductive case} \\
&\quad (\lambda x:\text{Nat}. \lambda y:\text{Nat}. S \; y) \quad (S \; 0) \quad (\text{nat_ind} \quad (S \; 0) \quad (\lambda x:\text{Nat}. \lambda y:\text{Nat}. S \; y) \quad (S \; 0)) \\
&\Rightarrow \quad !! \quad \text{inductive case} \\
&\quad (\lambda x:\text{Nat}. \lambda y:\text{Nat}. S \; y) \quad (S \; 0) \quad ((\lambda x:\text{Nat}. \lambda y:\text{Nat}. S \; y) \quad 0 \quad (\text{nat_ind} \quad (S \; 0) \quad (\lambda x:\text{Nat}. \lambda y:\text{Nat}. S \; y) \quad 0)) \\
&\Rightarrow \quad !! \quad \text{base case} \\
&\quad (\lambda x:\text{Nat}. \lambda y:\text{Nat}. S \; y) \quad (S \; 0) \quad ((\lambda x:\text{Nat}. \lambda y:\text{Nat}. S \; y) \quad 0 \quad (S \; 0)) \\
&\Rightarrow \\
&\quad (\lambda x:\text{Nat}. \lambda y:\text{Nat}. S \; y) \quad (S \; 0) \quad ((\lambda y:\text{Nat}. S \; y) \quad (S \; 0)) \\
&\Rightarrow \\
&\quad (\lambda x:\text{Nat}. \lambda y:\text{Nat}. S \; y) \quad (S \; 0) \quad (S \; (S \; 0)) \\
&\Rightarrow \\
&\quad (\lambda y:\text{Nat}. S \; y) \quad (S \; (S \; 0)) \\
&\Rightarrow \\
&\quad S \; (S \; (S \; 0))
\end{align*}
\]

In general, the small step semantics of `nat_ind` should work like:

\[
\text{nat_ind} \quad vz \quad vs \quad 3 \quad \Rightarrow^* \quad vs \quad 2 \quad (vs \quad 1 \quad (vs \quad 0 \quad vz))
\]

where we write `3` as a shorthand for `S S S 0`, etc.
Define the small-step operational semantics for `nat_plus`. There are three “structural” rules that evaluate the arguments to `nat_ind` in order from left-to-right. The first such rule is:

\[ tz \Rightarrow tz' \]

-----------------------------
\[ nat_ind\ tz\ ts\ tn \Rightarrow nat_ind\ tz'\ ts\ tn \]

Write the other two structural rules below. Use the `value` predicate as appropriate.

\[ \text{value}\ vz\ \text{value}\ vs \]

--------------------------------------------------------------------
\[ nat_ind\ vz\ vs\ 0 \Rightarrow \text{value}\ vz\ \text{value}\ vs\ \text{value}\ vn \]

--------------------------------------------------------------------
\[ nat_ind\ vz\ vs\ (S\ vn) \Rightarrow \]

After reducing all three arguments to values, the “interesting” rules of the small step semantics do case analysis on the third argument, yielding the base case, or performing a recursive call as appropriate. Complete these two rules for the small-step operational semantics of `nat_ind`.

\[ \text{value}\ vz\ \text{value}\ vs \]

--------------------------------------------------------------------
\[ nat_ind\ vz\ vs\ 0 \Rightarrow \]

\[ \text{value}\ vz\ \text{value}\ vs\ \text{value}\ vn \]

--------------------------------------------------------------------
\[ nat_ind\ vz\ vs\ (S\ vn) \Rightarrow \]
(c) It remains to give a typing rule for \texttt{nat\_ind}. We know that the third argument to \texttt{nat\_ind} is supposed to be a \texttt{Nat}, so that part is easy. The result type of a \texttt{nat\_ind} expression can be any type \( T \), since we could conceivably construct any value by induction on a natural number. We have filled in those parts of the typing rule below.

Your job is to complete the typing rule. Consider that this rule should be sound (i.e. satisfy preservation and progress) with respect to the operational semantics outlined above. For example, the term \texttt{Nat\_plus} defined in part (b) should be well-typed according to your rule.

\[
\begin{align*}
\Gamma \vdash tz & \in \\
\Gamma \vdash ts & \in \\
\Gamma \vdash tn & \in \texttt{Nat} \\
\end{align*}
\]

\[
\begin{align*}
\Gamma \vdash \texttt{nat\_ind} \ tzm \ tsm \ tnm & \in T \\
\end{align*}
\]
(d) Part (b) used \texttt{nat\_ind} to define the \texttt{Nat\_plus} function. Use \texttt{Nat\_plus} and \texttt{nat\_ind} to define multiplication of two numbers. We have provided the type of \texttt{Nat\_mult} to get you started:

\begin{verbatim}
(* Nat\_mult : Nat -> Nat -> Nat *)
\end{verbatim}

(e) A harder function to define using \texttt{nat\_ind} is natural number equality, a function \texttt{Nat\_eq} of type \texttt{Nat -> Nat -> Nat} such that \texttt{Nat\_eq n m ==>* 0} if \texttt{n} and \texttt{m} are different natural numbers and \texttt{Nat\_eq n m ==>* 1} if they are the same.

We have started the definition. Fill in the two blanks to complete it.

\begin{verbatim}
(* Nat\_eq : Nat -> Nat -> Nat *)
\end{verbatim}

\begin{verbatim}
\n:Nat. nat\_ind (____________________________) (* base case *)

____________________________ (* inductive case *)

n (* do induction on n *)
\end{verbatim}
7. (10 points) Subtyping

The rules for STLC with pairs and subtyping are given on page 21 for your reference. The subtyping relations among a collection of types can be visualized compactly in picture form: we draw a graph so that $S <: T$ iff we can get from $S$ to $T$ by following arrows in the graph (either directly or indirectly). For example, a picture for the types $\text{Top*Top}$, $\text{A*Top}$, $\text{Top*(Top*Top)}$, and $\text{Top*(A*A)}$ would look like this (it happens to form a tree, but that is not necessary in general):

```
Top*Top
   / \     /  \\
A*Top  Top*(Top*Top)  Top*(A*A)
```

Suppose we have defined types $A$ and $B$ so that $A <: B$. Draw a picture for the following six types.

- $\text{Top} \rightarrow (A * B)$
- $\text{Top} \rightarrow (A * A)$
- $(B * A) \rightarrow (B * A)$
- $(A * B) \rightarrow (B * A)$
- $(B * A) \rightarrow \text{Top}$
- $\text{Top}$
Formal definitions for Imp

Syntax

Inductive aexp : Type :=

\[ \{ P' \} c \{ Q' \}
\{ P \} c \{ Q \} \] (hoare_consequence)

\[ \{ P \land b \} c \{ P' \}
\{ P \land \neg b \} c \{ P' \} \] (hoare_consequence_pre)

\[ \{ P \} c \{ Q' \}
\{ Q' \} c \{ Q \} \] (hoare_consequence_post)
Decorated programs

(a) \texttt{SKIP} is locally consistent if its precondition and postcondition are the same:

\[
\begin{align*}
\{ & \texttt{P} \} \\
\texttt{SKIP} \\
\{ & \texttt{P} \}
\end{align*}
\]

(b) The sequential composition of \(c_1\) and \(c_2\) is locally consistent (with respect to assertions \(P\) and \(R\)) if \(c_1\) is locally consistent (with respect to \(P\) and \(Q\)) and \(c_2\) is locally consistent (with respect to \(Q\) and \(R\)):

\[
\begin{align*}
\{ & \texttt{P} \} \\
c_1; \\
\{ & \texttt{Q} \} \\
c_2 \\
\{ & \texttt{R} \}
\end{align*}
\]

(c) An assignment is locally consistent if its precondition is the appropriate substitution of its postcondition:

\[
\begin{align*}
\{ & \texttt{P \[X \mapsto a\]} \} \\
X := a \\
\{ & \texttt{P} \}
\end{align*}
\]

(d) A conditional is locally consistent (with respect to assertions \(P\) and \(Q\)) if the assertions at the top of its ”then” and ”else” branches are exactly \(P \wedge b\) and \(P \wedge \neg b\) and if its ”then” branch is locally consistent (with respect to \(P \wedge b\) and \(Q\)) and its ”else” branch is locally consistent (with respect to \(P \wedge \neg b\) and \(Q\)):

\[
\begin{align*}
\{ & \texttt{P} \} \\
\texttt{IFB} b \ \texttt{THEN} \\
\{ & \texttt{P \wedge b} \} \\
c_1 \\
\{ & \texttt{Q} \} \\
\texttt{ELSE} \\
\{ & \texttt{P \wedge \neg b} \} \\
c_2 \\
\{ & \texttt{Q} \} \\
\texttt{FI} \\
\{ & \texttt{Q} \}
\end{align*}
\]
(e) A while loop with precondition $P$ is locally consistent if its postcondition is $P \land \neg b$ and if the pre- and postconditions of its body are exactly $P \land b$ and $P$:

```
{{ P }}
WHILE b DO
  {{ P \land b }}
  c1
  {{ P }}
END
{{ P \land \neg b }}
```

(f) A pair of assertions separated by --> is locally consistent if the first implies the second (in all states):

```
{{ P }} -->
{{ P' }}
```
STLC with Natural Numbers

value v2
----------------------------- (ST_AppAbs)
(\x:T.t12) v2 ==> [x:=v2]t12

  t1 ==> t1'
  --------------- (ST_App1)
  t1 t2 ==> t1' t2

value v1
  t2 ==> t2'
  ---------------- (ST_App2)
  v1 t2 ==> v1 t2'

  t1 ==> t1'
  ------------------- (ST_Succ)
  S t1 ==> S t1'
Typing

\[ \Gamma \vdash x = T \quad (T_{\text{Var}}) \]

\[ \Gamma, x : T_{11} \vdash t_{12} \in T_{12} \quad (T_{\text{Abs}}) \]

\[ \Gamma \vdash \lambda x : T_{11}. t_{12} \in T_{11} \rightarrow T_{12} \quad (T_{\text{App}}) \]

\[ \Gamma \vdash t_{1} \in T_{11} \rightarrow T_{12} \]
\[ \Gamma \vdash t_{2} \in T_{11} \]

\[ \Gamma \vdash t_{1} \, t_{2} \in T_{12} \quad (T_{\text{Zero}}) \]

\[ \Gamma \vdash 0 \in \text{Nat} \quad (T_{\text{Succ}}) \]

\[ \Gamma \vdash t \in \text{Nat} \]

\[ \Gamma \vdash S \, t \in \text{Nat} \]
STLC with pairs and subtyping (excerpt)

Types

\[ T ::= \ldots \]
| Top
| \( T \rightarrow T \)
| \( T \times T \)

Subtyping relation

\[
\begin{align*}
S &<: U & U &<: T & \quad (S\text{\_Trans}) \\
S &<: T \\
T &<: T & \quad (S\text{\_Refl}) \\
S &<: \text{Top} & \quad (S\text{\_Top}) \\
S1 &<: T1 & S2 &<: T2 & \quad (S\text{\_Prod}) \\
S1\times S2 &<: T1\times T2 \\
T1 &<: S1 & S2 &<: T2 & \quad (S\text{\_Arrow}) \\
S1\rightarrow S2 &<: T1\rightarrow T2
\end{align*}
\]
