

Work, Energy, and Power

- Newton's Second Law
- Momentum
 - ◆ Linear momentum
 - ◆ Angular momentum
- Work
- Energy
 - ◆ Kinetic Energy
 - ◆ Potential Energy

Work

mass, m

Work done by the force \mathbf{F} on the particle P over the path from Q to R is given by:

$$W = \int_Q^R \mathbf{F} \cdot d\mathbf{r}$$

Note O is a point fixed in an *inertial* frame

$$\begin{aligned} dW &= \mathbf{F} \cdot d\mathbf{r} \\ &= m\ddot{\mathbf{r}} \cdot d\mathbf{r} \\ &= \frac{1}{2}m d(\dot{\mathbf{r}} \cdot \dot{\mathbf{r}}) \end{aligned}$$

Recall

$$a = \frac{dv}{dt} \quad adx = vdv$$

$$a = \frac{dv}{dx}v \quad adx = \frac{1}{2}d(v \cdot v)$$

The work done by \mathbf{F} is equal to the change in the *kinetic energy* of the particle

$$W_{QR} = \int_Q^R \mathbf{F} \cdot d\mathbf{r} = \frac{1}{2}m(v_R^2 - v_Q^2)$$

Mechanical Power

\mathbf{F} acts on the particle

- Work done by \mathbf{F}

$$dW = \mathbf{F} \cdot d\mathbf{r}$$

- Power developed by \mathbf{F}

$$\begin{aligned} \frac{dW}{dt} &= \mathbf{F} \cdot \frac{d\mathbf{r}}{dt} \\ &= \mathbf{F} \cdot \mathbf{v}_P \end{aligned}$$

- Units

Metric

- ◆ Watts = Newton meter/second

British

- ◆ Lb ft/second
- ◆ Horsepower
 - ◆ 1HP = 550 lb ft/sec
 - ◆ 1 HP = 746 W

Boeing 777-200

2 P&W turbofan engines providing ~ 74,000 lbs of thrust

Maximum take-off weight (MTOW) ~230,000 kg.

1 mile runway ~ 1600 m

What do you estimate the speed to be at the end of a 1 mile runway?

Estimated speed at the end of runway without drag = 96 m/s

But... take-off speed ~ 300 kmph (83.33 m/s)

What is the estimated drag force?

KE at the speed of 83.33 m/s = 798,610,000 Joules

Estimated average force through the length of the runway = 496 kN

Thrust = 2×329 kN

Drag force ~ 161 kN

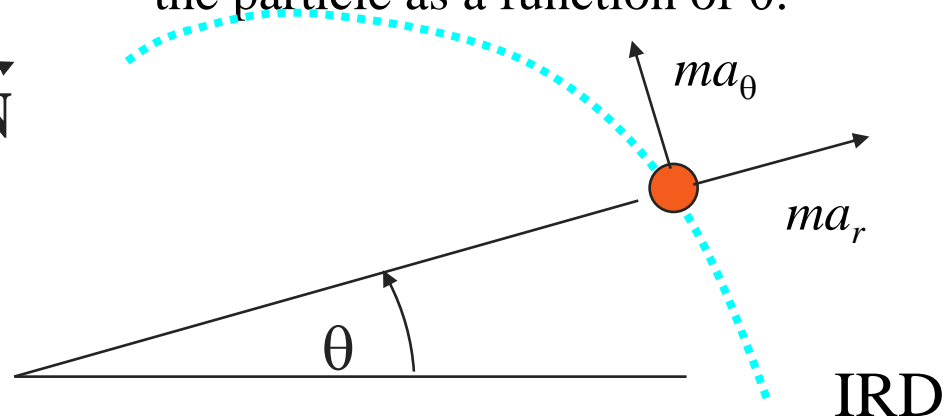

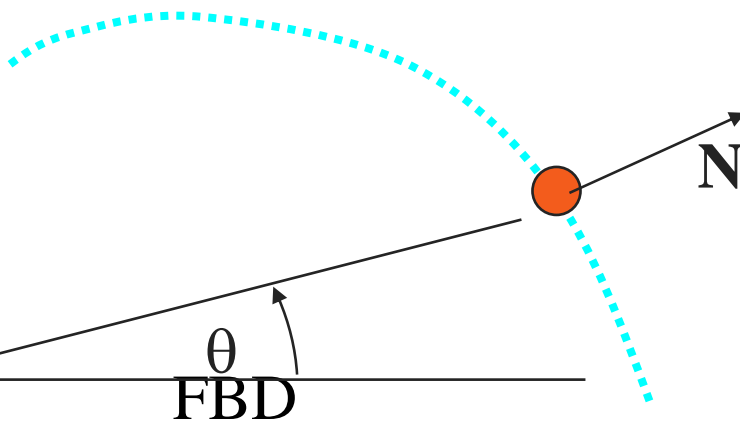

Example

A particle of mass m slides along a horizontal frictionless track which is shaped like a logarithmic spiral:

$$r = r_0 \exp(-a\theta)$$

If the initial speed is v_0 when $\theta=0$, find the speed of the particle and the magnitude of the track force acting on the particle as a function of θ .

Example

Horizontal frictionless track which is shaped like a logarithmic spiral

$$r = r_0 \exp(-a\theta)$$

The initial speed is v_0 when $\theta=0$

Find the speed of the particle and the magnitude of the track force acting on the particle.

$$\mathbf{r} = r \mathbf{b}_1$$

$$\mathbf{v}_P = r\dot{\theta} (-a \mathbf{b}_1 + \mathbf{b}_2) = v \mathbf{e}_2$$

$$\text{Track force} = N \mathbf{e}_1$$

Force in the \mathbf{e}_2 direction?

$$\mathbf{e}_1 = \frac{\mathbf{b}_1 + a\mathbf{b}_2}{\sqrt{1+a^2}} \quad (\text{unit normal})$$

$$\mathbf{e}_2 = \frac{-a\mathbf{b}_1 + \mathbf{b}_2}{\sqrt{1+a^2}} \quad (\text{Same as } \mathbf{e}_t)$$

Example

Since \mathbf{N} is normal to the track, $d\mathbf{r}$ is tangential to the track.

$$W = \int_{r_0}^r \mathbf{N} \cdot d\mathbf{r} = \boxed{}$$

Therefore the speed of the particle is...

$$\boxed{}$$

$$\mathbf{e}_1 = \frac{\mathbf{b}_1 + a\mathbf{b}_2}{\sqrt{1+a^2}}$$

$$\mathbf{e}_2 = \frac{-a\mathbf{b}_1 + \mathbf{b}_2}{\sqrt{1+a^2}}$$

$$\mathbf{v}_P = v \mathbf{e}_2 \quad \Rightarrow \quad \mathbf{a}_P = \boxed{}$$

Newton's Laws

$$\frac{d}{dt}(m \mathbf{v}_P) = N\mathbf{e}_1$$

$$\frac{d}{dt}(r\mathbf{b}_1 \times m \mathbf{v}_P) = r\mathbf{b}_1 \times N\mathbf{e}_1$$

Conservative Force Field

Four equivalent definitions.

\mathbf{F} is conservative

- \mathbf{F} is a function only of the position of the particle and the work done by the force \mathbf{F} on the particle P to get it from Q to R is independent of the path

- \mathbf{F} is a function only of the position of the particle and the work done by the force \mathbf{F} on the particle P is zero along *any* closed path

- There exists a scalar function ϕ (\mathcal{PE}) such that

$$dW = \mathbf{F} \cdot d\mathbf{r} = -d\phi$$

- There exists a scalar function ϕ (\mathcal{PE}) and a coordinate s such that*

$$F = \frac{-d\phi}{ds}$$

For multiple coordinates say x and y : $F_x = \frac{-\partial\phi}{\partial x}$; $F_y = \frac{-\partial\phi}{\partial y}$

Conservation of Mechanical Energy

\mathbf{F} is conservative

- There exists a scalar function ϕ such that

$$dW = \mathbf{F} \cdot d\mathbf{r} = -d\phi$$

- Work done by \mathbf{F}

$$\begin{aligned} W_{QR} &= \int_Q^R \mathbf{F} \cdot d\mathbf{r} = \frac{1}{2}m(v_R^2 - v_Q^2) \\ &= \phi(Q) - \phi(R) \end{aligned}$$

- Total energy is constant

$$\frac{1}{2}m(v_R^2) + \phi(R) = \frac{1}{2}m(v_Q^2) + \phi(Q)$$

Example

Find the magnitude of the force \mathbf{T} which acts on the midpoint of the crank, given the force \mathbf{F} acts on the piston. Neglect inertia, friction and gravity.

Velocity Equations (from before)

$$\dot{r}_1 = r_2 \frac{\sin(\theta_3 - \theta_2)}{\cos(\theta_3)} \dot{\theta}_2$$

$$\dot{\theta}_3 = -\frac{r_2 \cos(\theta_2)}{r_3 \cos(\theta_3)} \dot{\theta}_2$$
