

## CIS 550, Fall 2007

### SEAS Tomcat Server Information

#### Installation of Files

To install your servlet on Tomcat, you should create a directory for your team under /mnt/eclipse/tomcat/cis550 on eniac (or other SEAS machines). You can copy your files under this directory. PLEASE do not copy anything into anyone else's directory.

#### Administration

You will need to load your servlet and give it a path using:

<http://fling-l.seas.upenn.edu:8080/manager/html>

#### Accessing Your Servlet

Your servlet will be available at:

<http://fling.seas.upenn.edu:8080/cis550/{whatever}>

(where {whatever} represents the name you gave your servlet under the manager tool.)

Port 8080 should not be blocked by the SEAS firewall, and hence your servlet should be accessible from off campus.

#### Note

Please debug your servlet as much as possible *before* running it on the shared Tomcat instance, so you aren't the person who brings down the entire server! You may want to download Apache Tomcat on a local machine and work on that initially.
