<b>Pseudo-Instructions</b>		
RET	Return to R7	JMPR R7
LEA Rd <Label>	Store address of <Label> in Rd	CONST/HICONST
LC Rd <Label>	Store value of constant <Label> in Rd	CONST/HICONST
<b>Assembler Directives</b>		
.CODE	Current memory section contains instruction code	
.DATA	Current memory section contains data values	
.ADDR UIMM16	Set current memory address value to UIMM16	
.FALIGN	Pad current memory address to next multiple of 16	
.FILL IMM16	Current memory address's value = IMM16	
.STRINGZ "String"	Expands to a .FILL for each character in "String"	
.BLKW UIMM16	Reserve UIMM16 words of memory from the current address	
<Label> .CONST IMM16	Associate <Label> with IMM16	
<Label> .UCONST UIMM16	Associate <Label> with UIMM16	

0101: opcode or sub-opcode    **ddd**: destination register    **sss**: source register 1    **ttt**: source register 2  
                                     **iii**: signed immediate value    **uuu**: unsigned immediate value    **xxx**: “don’t care” value

<sup>1</sup>In this case the source and destination register are one and the same as HICONST reads and modifies the same register.

<sup>2</sup> $\text{sign}(Rs - Rt)$  results in one of three values: +1, 0, or -1, which set the appropriate bit in the NZP register.

<sup>3</sup> $\text{sign}(uRs - uRt)$  indicates that Rs and Rt are treated as unsigned values.

<sup>4</sup>The NZP register is updated on any instruction that writes to a register, and on CMPx instructions.
