CIS 500

Software Foundations Fall 2003

17 November

Administrivia

- ♦ Migterm results available in LVN 302
- ♦ Rough grade breakdown:

65-80: A (22%)

48-64: B (33%)

35-49: C (30%)

<34: D/F (20%)

60+ points is on-target for WPE-I

♦ Grading questions? See your TA.

Comments on Exam

- ◆ Performance on "proof" parts was very bimodal (and strongly correlated with ability to draw derivation trees!)
- ♦ A number of people did poorly on the final question, which was taken verbatim from a recent homework.
 - There will be a homework problem on the final exam.
- ♦ In general, MT2 is a good indication of the difficulty of the final exam

Subtyping (Review)

Subtype relation

$$\frac{S <: U \quad U <: T}{S <: T}$$
 (S-Trans)

$$\{l_i:T_i^{i\in 1..n+k}\} \leftarrow \{l_i:T_i^{i\in 1..n}\}$$
 (S-RCDWIDTH)

$$\frac{\text{for each i} \quad S_i <: T_i}{\{l_i : S_i \quad ^{i \in 1..n}\} <: \{l_i : T_i \quad ^{i \in 1..n}\}} \tag{S-RcdDepth}$$

$$\frac{\{k_j\!:\!S_j^{\ j\in 1\dots n}\}\ \text{is a permutation of}\ \{l_i\!:\!T_i^{\ i\in 1\dots n}\}}{\{k_j\!:\!S_j^{\ j\in 1\dots n}\}\mathrel{<\!:}\{l_i\!:\!T_i^{\ i\in 1\dots n}\}} \text{(S-RcdPerm)}$$

$$\frac{T_1 <: S_1 \qquad S_2 <: T_2}{S_1 \rightarrow S_2 <: T_1 \rightarrow T_2}$$
 (S-Arrow)

Subsumption Rule

$$\frac{\Gamma \vdash t : S \qquad S <: T}{\Gamma \vdash t : T}$$
 (T-SUB)

Other typing rules as in λ_{\rightarrow}

Metatheory of Subtyping (Preview)

Syntax-directed rules

In the simply typed lambda-calculus (without subtyping), each rule can be "read from bottom to top" in a straightforward way.

$$\frac{\Gamma \vdash \mathsf{t}_1 : \mathsf{T}_{11} \rightarrow \mathsf{T}_{12}}{\Gamma \vdash \mathsf{t}_1 \ \mathsf{t}_2 : \mathsf{T}_{12}} \qquad \qquad \mathsf{(T-APP)}$$

If we are given some Γ and some t of the form t_1 t_2 , we can try to find a type for t by

- 1. finding (recursively) a type for t_1
- 2. checking that it has the form $T_{11} \rightarrow T_{12}$
- 3. finding (recursively) a type for t2
- 4. checking that it is the same as T_{11}

Technically, the reason this works is that We can divide the "positions" of the typing relation into input positions (Γ and t) and output positions (Γ).

- ♦ For the input positions, all metavariables appearing in the premises also appear in the conclusion (so we can calculate inputs to the "subgoals" from the subexpressions of inputs to the main goal)
- ♦ For the output positions, all metavariables appearing in the conclusions also appear in the premises (so we can calculate outputs from the main goal from the outputs of the subgoals)

$$\frac{\Gamma \vdash \mathsf{t}_1 : \mathsf{T}_{11} \rightarrow \mathsf{T}_{12}}{\Gamma \vdash \mathsf{t}_1 \; \mathsf{t}_2 : \mathsf{T}_{12}} \qquad \qquad \mathsf{(T-APP)}$$

Syntax-directed sets of rules

The second important point about the simply typed lambda-calculus is that the set of typing rules is syntax-directed, in the sense that, for every "input" Γ and t, there one rule that can be used to derive typing statements involving t.

E.g., if t is an application, then we must proceed by trying to use T-APP. If we succeed, then we have found a type (indeed, the unique type) for t. If it fails, then we know that t is not typable.

→ no backtracking!

Non-syntax-directedness of typing

When we extend the system with subtyping, both aspects of syntax-directedness get broken.

1. The set of typing rules now includes two rules that can be used to give a type to terms of a given shape (the old one plus T-SUB)

$$\frac{\Gamma \vdash t : S \qquad S \lt: T}{\Gamma \vdash t : T}$$
 (T-SUB)

2. Worse yet, the new rule T-SUB itself is not syntax directed: the inputs to the left-hand subgoal are exactly the same as the inputs to the main goal!

(Hence, if we translated the typing rules naively into a typechecking function, the case corresponding to T-SUB would cause divergence.)

Non-syntax-directedness of subtyping

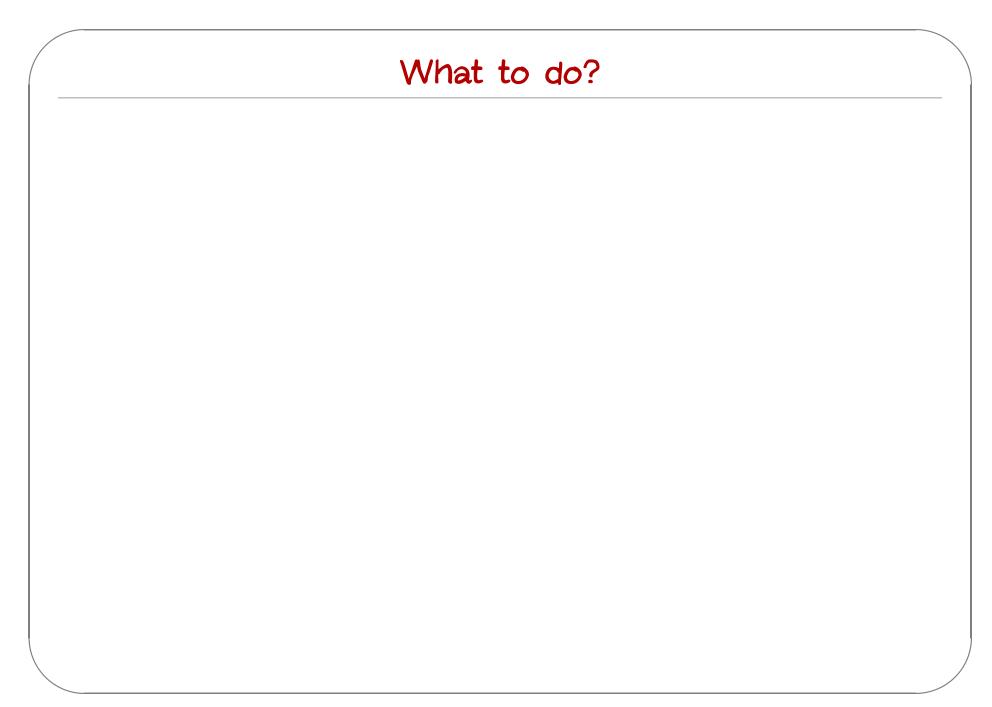

Moreover, the subtyping relation is not syntax directed either.

- 1. There are lots of ways to derive a given subtyping statement.
- 2. The transitivity rule

$$\frac{S <: U \quad U <: T}{S <: T}$$
 (S-Trans)

is badly non-syntax-directed: the premises contain a metavariable (in an "input position") that does not appear at all in the conclusion.

To implement this rule naively, we'd have to guess a value for U!

What to do?

- 1. Observation: We don't need 1000 ways to prove a given typing or subtyping statement one is enough.
 - Think more carefully about the typing and subtyping systems to see where we can get rid of excess flexibility
- 2. Use the resulting intuitions to formulate new "algorithmic" (i.e., syntax-directed) typing and subtyping relations
- 3. Prove that the algorithmic relations are "the same as" the original ones in an appropriate sense.

Metatheory of Subtyping

Subtype relation

$$\frac{S <: U \quad U <: T}{S <: T}$$
 (S-TRANS)

$$\{l_i:T_i^{i\in 1..n+k}\} \leftarrow \{l_i:T_i^{i\in 1..n}\}$$
 (S-RCDWIDTH)

$$\frac{\text{for each i} \quad S_i <: T_i}{\{l_i : S_i \quad ^{i \in 1..n}\} <: \{l_i : T_i \quad ^{i \in 1..n}\}} \tag{S-RcdDepth}$$

$$\frac{\{k_j\!:\!S_j^{\ j\in 1..n}\}\ \text{is a permutation of}\ \{l_i\!:\!T_i^{\ i\in 1..n}\}}{\{k_j\!:\!S_j^{\ j\in 1..n}\}\mathrel{<\!:}\{l_i\!:\!T_i^{\ i\in 1..n}\}} \text{(S-RcdPerm)}$$

$$\frac{T_1 <: S_1 \qquad S_2 <: T_2}{S_1 \rightarrow S_2 <: T_1 \rightarrow T_2}$$
 (S-ARROW)

For a given subtyping statement, there are multiple rules that could be used last in a derivation.

- 1. S-RCD-WIDTH, S-RCD-DEPTH, and S-RCD-PERM overlap with each other
- 2. S-REFL and S-TRANS overlap with everything

Step 1: simplify record subtyping

Idea: combine all three record subtyping rules into one "macro rule" that captures all of their effects

$$\frac{\{1_{i}^{i \in 1..n}\} \subseteq \{k_{j}^{j \in 1..m}\} \quad k_{j} = 1_{i} \text{ implies } S_{j} <: T_{i}}{\{k_{j} : S_{j}^{j \in 1..m}\} <: \{1_{i} : T_{i}^{i \in 1..n}\}}$$
 (S-RcD)

Simpler subtype relation

$$\frac{S <: U \quad U <: T}{S <: T}$$
 (S-Trans)

$$\frac{\{1_{i}^{i \in 1..n}\} \subseteq \{k_{j}^{j \in 1..m}\} \quad k_{j} = 1_{i} \text{ implies } S_{j} <: T_{i}}{\{k_{j} : S_{j}^{j \in 1..m}\} <: \{1_{i} : T_{i}^{i \in 1..n}\}}$$
 (S-RcD)

$$\frac{T_1 <: S_1 \qquad S_2 <: T_2}{S_1 \rightarrow S_2 <: T_1 \rightarrow T_2}$$
 (S-ARROW)

$$S <: Top$$
 (S-Top)

Step 2: Get rid of reflexivity

Observation: S-REFL is unnecessary.

Lemma: S <: S can be derived for every type without using S-REFL.

Even simpler subtype relation

$$\frac{S <: U \quad U <: T}{S <: T}$$
 (S-TRANS)

$$\frac{\{1_{i}^{i\in 1..n}\}\subseteq \{k_{j}^{j\in 1..m}\} \quad k_{j}=1_{i} \text{ implies } S_{j} <: T_{i}}{\{k_{j}:S_{j}^{j\in 1..m}\} <: \{1_{i}:T_{i}^{i\in 1..n}\}}$$
 (S-RcD)

$$\frac{T_1 <: S_1 \qquad S_2 <: T_2}{S_1 \rightarrow S_2 <: T_1 \rightarrow T_2}$$
 (S-ARROW)

$$S <: Top$$
 (S-Top)

Step 3: Get rid of transitivity

Observation: S-TRANS is unnecessary.

Lemma: If S <: T can be derived, then there is a derivation that does not use S-TRANS.

"Algorithmic" subtype relation

$$\frac{\vdash T_1 <: S_1}{\vdash S_1 \rightarrow S_2 <: T_1 \rightarrow T_2} \qquad (SA-ARROW)$$

$$\frac{\{l_i^{i\in 1..n}\}\subseteq \{k_j^{j\in 1..m}\}\quad \text{for each } k_j=l_i, \ \mapsto S_j <: \ T_i}{\mapsto \{k_j\!:\! S_j^{j\in 1..m}\} <: \{l_i\!:\! T_i^{i\in 1..n}\}} \text{(SA-RcD)}$$

Soundness and completeness

```
Theorem: S <: T \text{ iff } \mapsto S <: T.
```

Proof: ...

Terminology:

- ♦ The algorithmic presentation of subtyping is sound with respect to the original if → S <: T implies S <: T.</p>
 (Everything validated by the algorithm is actually true.)
- ♦ The algorithmic presentation of subtyping is complete with respect to the original if S <: T implies $\vdash S <: T$.

(Everything true is validated by the algorithm.)

Subtyping Algorithm (pseudo-code)

The algorithmic rules can be translated directly into code:

```
\label{eq:subtype} \begin{array}{lll} \text{subtype}(S,T) &=& \text{if } T=\text{Top, then true} \\ & \text{else if } S=S_1{\rightarrow}S_2 \text{ and } T=T_1{\rightarrow}T_2 \\ & \text{then subtype}(T_1,S_1) \ \land \ \text{subtype}(S_2,T_2) \\ & \text{else if } S=\{k_j{:}S_j^{-j\in 1..m}\} \text{ and } T=\{1_i{:}T_i^{-i\in 1..n}\} \\ & \text{then} \quad \{1_i^{-i\in 1..n}\} \subseteq \{k_j^{-j\in 1..m}\} \\ & \land \text{ for all } i \text{ there is some } j\in 1..m \text{ with } k_j=1_i \\ & \text{and subtype}(S_j,T_i) \\ & \text{else false.} \end{array}
```

A decision procedure for a relation $R \subseteq U$ is a total function p from U to $\{true, false\}$ such that p(u) = true iff $u \in R$.

A decision procedure for a relation $R \subseteq U$ is a total function p from U to $\{true, false\}$ such that p(u) = true iff $u \in R$.

Is our subtype function a decision procedure?

A decision procedure for a relation $R \subseteq U$ is a total function p from U to $\{true, false\}$ such that p(u) = true iff $u \in R$.

Is our subtype function a decision procedure?

Since subtype is just an implementation of the algorithmic subtyping rules, we have

- 1. if subtype(S,T) = true, then $\rightarrow S <: T$ (hence, by soundness of the algorithmic rules, S <: T)
- 2. if subtype(S,T) = false, then not $\vdash S \leq T$ (hence, by completeness of the algorithmic rules, not $S \leq T$)

A decision procedure for a relation $R \subseteq U$ is a total function p from U to $\{true, false\}$ such that p(u) = true iff $u \in R$.

Is our subtype function a decision procedure?

Since subtype is just an implementation of the algorithmic subtyping rules, we have

- 1. if subtype(S,T) = true, then $\rightarrow S <: T$ (hence, by soundness of the algorithmic rules, S <: T)
- 2. if subtype(S, T) = false, then not ► S <: T</p>
 (hence, by completeness of the algorithmic rules, not S <: T)</p>

Q: What's missing?

A decision procedure for a relation $R \subseteq U$ is a total function p from U to $\{true, false\}$ such that p(u) = true iff $u \in R$.

Is our subtype function a decision procedure?

Since subtype is just an implementation of the algorithmic subtyping rules, we have

- 1. if subtype(S,T) = true, then $\rightarrow S <: T$ (hence, by soundness of the algorithmic rules, S <: T)
- 2. if subtype(S, T) = false, then not ► S <: T</p>
 (hence, by completeness of the algorithmic rules, not S <: T)</p>

Q: What's missing?

A: How do we know that subtype is a total function?

A decision procedure for a relation $R \subseteq U$ is a total function p from U to $\{true, false\}$ such that p(u) = true iff $u \in R$.

Is our subtype function a decision procedure?

Since subtype is just an implementation of the algorithmic subtyping rules, we have

- 1. if subtype(S,T) = true, then $\rightarrow S <: T$ (hence, by soundness of the algorithmic rules, S <: T)
- 2. if subtype(S, T) = false, then not ► S <: T
 (hence, by completeness of the algorithmic rules, not S <: T)

Q: What's missing?

A: How do we know that subtype is a total function?

Prove it!

Metatheory of Typing

For the typing relation, we have just one problematic rule to deal with: subsumption.

$$\frac{\Gamma \vdash t : S \qquad S <: T}{\Gamma \vdash t : T}$$
 (T-SUB)

Where is this rule really needed?

For the typing relation, we have just one problematic rule to deal with: subsumption.

$$\frac{\Gamma \vdash t : S \qquad S \lt: T}{\Gamma \vdash t : T}$$
 (T-SUB)

Where is this rule really needed?

For applications. E.g., the term

$$(\lambda r:\{x:Nat\}. r.x) \{x=0,y=1\}$$

is not typable without using subsumption.

For the typing relation, we have just one problematic rule to deal with: subsumption.

$$\frac{\Gamma \vdash t : S \qquad S \leqslant T}{\Gamma \vdash t : T}$$
 (T-SUB)

Where is this rule really needed?

For applications. E.g., the term

$$(\lambda r:\{x:Nat\}. r.x) \{x=0,y=1\}$$

is not typable without using subsumption.

Where else??

For the typing relation, we have just one problematic rule to deal with: subsumption.

$$\frac{\Gamma \vdash t : S \qquad S \lt: T}{\Gamma \vdash t : T}$$
 (T-SUB)

Where is this rule really needed?

For applications. E.g., the term

$$(\lambda r: \{x: Nat\}. r.x) \{x=0, y=1\}$$

is not typable without using subsumption.

Where else??

Nowhere else! Uses of subsumption to help typecheck applications are the only interesting ones.

$$\begin{array}{c} \vdots \\ \hline \Gamma, x: S_1 \vdash s_2 : S_2 \\ \hline \hline \Gamma, x: S_1 \vdash s_2 : T_2 \\ \hline \hline \Gamma, x: S_1 \vdash s_2 : T_2 \\ \hline \hline \Gamma \vdash \lambda x: S_1. s_2 : S_1 \rightarrow T_2 \\ \end{array}$$
 (T-ABS)

$$\begin{array}{c} \vdots \\ \hline \Gamma, x: S_1 \vdash s_2 : S_2 \\ \hline \hline \Gamma, x: S_1 \vdash s_2 : T_2 \\ \hline \hline \Gamma, x: S_1 \vdash s_2 : T_2 \\ \hline \hline \Gamma \vdash \lambda x: S_1. s_2 : S_1 \rightarrow T_2 \\ \end{array}$$
 (T-ABS)

becomes

$$\frac{\vdots}{\Gamma, \text{x}: \text{S}_1 \vdash \text{s}_2 : \text{S}_2} \frac{\vdots}{\text{S}_1 \leftarrow \text{S}_2 : \text{S}_1 \rightarrow \text{S}_2} (\text{T-ABS}) \frac{\vdots}{\text{S}_1 \leftarrow \text{S}_1 \cdot \text{S}_1} \frac{\vdots}{\text{S}_2 \leftarrow \text{S}_1 \rightarrow \text{T}_2} (\text{S-ARROW})}{\text{S}_1 \rightarrow \text{S}_2 \leftarrow \text{S}_1 \rightarrow \text{T}_2} (\text{T-SUB})$$

```
T_{11} <: S_{11}  S_{12} <: T_{12}
                                                                                 - (S-ARROW)
