1-3 December

Where we are...

CIS 500, 1-3 December

CIS 500, 1-3 December

The (an) essence of objects

- ♦ Multiple representations
- Encapsulation of state with behavior
- Subtyping
- ♦ Inheritance (incremental definition of behaviors)
- ♦ "Open recursion" through self

What's missing

The peculiar status of classes (which are both run-time and compile-time things)

Named types with declared subtyping

Recursive types

Run-time type analysis (casting, etc.)

(...lots of other stuff)

Modeling Java

Quick Check

How many non-Java-hackers in the room?...

CIS 500, 1-3 December

Models in General

No such thing as a "perfect model" — The nature of a model is to abstract away from details!

So models are never just "good": they are always "good for some specific set of purposes."

CIS 500, 1-3 December

Models of Java

Lots of different purposes — lots of different kinds of models

- ♦ Source-level vs. bytecode level
- ♦ Large (inclusive) vs. small (simple) models
- ♦ Models of type system vs. models of run-time features (not entirely separate issues)
- ♦ Models of specific features (exceptions, concurrency, reflection, class loading, ...)
- ♦ Models designed for extension

Featherweight Java

Purpose: model the "core OO features" and their types and nothing else.

History:

- ♦ Originally proposed by a Penn PhD student (Atsushi Igarashi) as a tool for analyzing GJ ("Java plus generics")
- ♦ Since used by many others for studying a wide variety of Java features and proposed extensions

Things left out

Reflection, concurrency, class loading, inner classes, ...

CIS 500, 1-3 December

9

CIS 500, 1-3 December

Things left out

- Reflection, concurrency, class loading, inner classes, ...
- ♦ Exceptions, loops, ...
- ♦ Interfaces, overloading, ...

Things left out

- Reflection, concurrency, class loading, inner classes, ...
- ♠ Exceptions, loops, ...

CIS 500, 1-3 December

10-a

CIS 500, 1-3 December

10-b

Things left out

Example

- Reflection, concurrency, class loading, inner classes, ...
- ♠ Exceptions, loops, ...
- ♦ Interfaces, overloading, ...
- ♦ Assignment (!!)

CIS 500, 1-3 December

class A extends Object { A() { super(); } } class B extends Object { B() { super(); } } class Pair extends Object { Object fst; Object snd; Pair(Object fst, Object snd) { super(); this.fst=fst; this.snd=snd; } Pair setfst(Object newfst) { return new Pair(newfst, this.snd); } }

Things left in

- Classes and objects
- Methods and method invocation
- Fields and field access
- ♦ Inheritance (including open recursion through this)
- Casting

CIS 500, 1-3 December

Conventions

For syntactic regularity...

- ♦ Always include superclass (even when it is Object)
- ♦ Always write out constructor (even when trivial)
- Always call super from constructor (even when no arguments are passed)
- ♦ Always explicitly name receiver object in method invocation or field access (even when it is this)
- ♦ Methods always consist of a single return expression
- ♦ Constructors always
 - Take same number (and types) of parameters as fields of the class
 - Assign constructor parameters to "local fields"
 - Call super constructor to assign remaining fields
 - Do nothing else

CIS 500, 1-3 December 12 CIS 500, 1-3 December 1

10-c

Formalizing FJ

CIS 500, 1-3 December

Advantages of Structural Systems

Somewhat simpler, cleaner, and more elegant (no need to always work wrt. a set of "name definitions")

Easier to extend (e.g. with parametric polymorphism)

Caveat: when recursive types are considered, some of this simplicity and elegance slips away...

Nominal type systems

Big dichotomy in the world of programming languages:

- ♦ Structural type systems:
 - What matters about a type (for typing, subtyping, etc.) is just its structure.
 - Names are just convenient (but inessential) abbreviations.
- ♦ Nominal type systems:
 - Types are always named.
 - Typechecker mostly manipulates names, not structures.
 - Subtyping is declared explicitly by programmer (and checked for consistency by compiler).

CIS 500, 1-3 December

Advantages of Nominal Systems

Recursive types fall out easily

Using names everywhere makes typechecking (and subtyping, etc.) easy and efficient

Type names are also useful at run-time (for casting, type testing, reflection, ...).

Java (like most other mainstream languages) is a nominal system.

CIS 500, 1-3 December 16 CIS 500, 1-3 December 1

Representing objects

Our decision to omit assignment has a nice side effect...

The only ways in which two objects can differ are (1) their classes and (2) the parameters passed to their constructor when they were created.

All this information is available in the new expression that creates an object. So we can identify the created object with the new expression.

Formally: object values have the form new C(v)

CIS 500, 1-3 December 18 CIS 500, 1-3 December 1

Syntax (terms and values)

```
t ::=
                                                             terms
                                                               variable
          X
                                                               field access
          t.f
          t.m(\overline{t})
                                                               method invocation
                                                               object creation
          new C(\overline{t})
          (C) t
                                                               cast
v ::=
                                                              values
          new C(\overline{v})
                                                               object creation
```

Syntax (methods and classes)

FJ Syntax

CIS 500, 1-3 December 20 CIS 500, 1-3 December 21

Subtyping

Subtyping

As in Java, subtyping in FJ is declared.

Assume we have a (global, fixed) class table CT mapping class names to definitions.

$$\frac{CT(C) = class \ C \ extends \ D \ \{...\}}{C <: \ D}$$

$$C <: \ C$$

$$\frac{C <: \ D \ D <: \ E}{C <: \ E}$$

CIS 500, 1-3 December

22

CIS 500, 1-3 December

23

More auxiliary definitions

From the class table, we can read off a number of other useful properties of the definitions (which we will need later for typechecking and operational semantics)...

Fields lookup

$$fields(Object) = \emptyset$$

$$\begin{split} & \textbf{CT(C)} = \textbf{class C extends D } \{\overline{\textbf{C}} \ \overline{\textbf{f}}; \ \textbf{K} \ \overline{\textbf{M}}\} \\ & \underline{ & \quad \quad \textbf{fields}(\textbf{D}) = \overline{\textbf{D}} \ \overline{\textbf{g}} } \\ & \underline{ & \quad \quad \textbf{fields}(\textbf{C}) = \overline{\textbf{D}} \ \overline{\textbf{g}}, \overline{\textbf{C}} \ \overline{\textbf{f}} \end{split}$$

Method type lookup

$$\begin{split} & \textbf{CT}(\texttt{C}) = \texttt{class} \ \texttt{C} \ \texttt{extends} \ \texttt{D} \ \{\overline{\texttt{C}} \ \overline{\texttt{f}}; \ \texttt{K} \ \overline{\texttt{M}}\} \\ & \underline{ & \texttt{B} \ \texttt{m} \ (\overline{\texttt{B}} \ \overline{\texttt{x}}) \ \{\texttt{return} \ \texttt{t};\} \in \overline{\texttt{M}} \\ & \underline{ & \texttt{mtype}(\texttt{m},\texttt{C}) = \overline{\texttt{B}} \rightarrow \texttt{B}} \end{split}$$

$$\begin{split} \text{CT}(\texttt{C}) &= \texttt{class} \ \texttt{C} \ \texttt{extends} \ \texttt{D} \ \{\overline{\texttt{C}} \ \overline{\texttt{f}}; \ \texttt{K} \ \overline{\texttt{M}}\} \\ & \underline{ \text{m is not defined in } \overline{\texttt{M}} } \\ & \underline{ \text{mtype}(\texttt{m},\texttt{C}) = \text{mtype}(\texttt{m},\texttt{D})} \end{split}$$

Method body lookup

$$CT(C) = class C extends D \{\overline{C} \ \overline{f}; K \ \overline{M}\}$$

$$B m (\overline{B} \ \overline{x}) \{return \ t;\} \in \overline{M}$$

$$mbody(m,C) = (\overline{x},t)$$

$$\begin{split} \text{CT(C) = class C extends D } \{\overline{\text{C}} \ \overline{\text{f}}; \ \text{K} \ \overline{\text{M}}\} \\ & \qquad \qquad \text{m is not defined in } \overline{\text{M}} \\ & \qquad \qquad \qquad \\ \hline & \qquad \qquad \qquad \\ & \qquad \qquad \qquad \\ & \qquad \qquad \qquad \\ &$$

CIS 500, 1-3 December

26

CIS 500, 1-3 December

27

Valid method overriding

$$\frac{\text{mtype}(\mathtt{m},\mathtt{D}) = \overline{\mathtt{D}} \!\!\to\! \mathtt{D}_0 \ \text{implies} \ \overline{\mathtt{C}} = \overline{\mathtt{D}} \ \text{and} \ \mathtt{C}_0 = \mathtt{D}_0}{\text{override}(\mathtt{m},\mathtt{D},\overline{\mathtt{C}} \!\!\to\! \mathtt{C}_0)}$$

Evaluation

The example again

```
class A extends Object { A() { super(); } }

class B extends Object { B() { super(); } }

class Pair extends Object {
   Object fst;
   Object snd;

Pair(Object fst, Object snd) {
     super(); this.fst=fst; this.snd=snd; }

Pair setfst(Object newfst) {
     return new Pair(newfst, this.snd); }
}
```

CIS 500, 1-3 December 30

Evaluation

Casting:

(Pair)new Pair(new A(), new B()) \longrightarrow new Pair(new A(), new B())

Evaluation

Projection:

```
new Pair(new A(), new B()).snd \longrightarrow new B()
```

CIS 500, 1-3 December

Evaluation

Method invocation:

```
new Pair(new A(), new B()).setfst(new B())
\longrightarrow \begin{bmatrix} newfst \mapsto new B(), \\ this \mapsto new Pair(new A(), new B()) \end{bmatrix}
new Pair(newfst, this.snd)
i.e., new Pair(new B(), new Pair(new A(), new B()).snd)
```

((Pair) (new Pair(new A(), new B()), new A())

- ((Pair)new Pair(new A(),new B())).snd
- new Pair(new A(), new B()).snd
- new B()

.fst).snd

 $\mathbf{fields}(\mathtt{C}) = \overline{\mathtt{C}} \ \overline{\mathtt{f}}$ (E-PROJNEW) (new $C(\overline{v})$). $f_i \longrightarrow v_i$

Evaluation rules

 $mbody(m, C) = (\overline{x}, t_0)$ (E-INVKNEW) (new $C(\overline{v})$).m(\overline{u}) $\longrightarrow [\overline{x} \mapsto \overline{u}, \text{ this } \mapsto \text{new } C(\overline{v})]t_0$

C <: D (E-CASTNEW) (D) (new $C(\overline{v})$) \longrightarrow new $C(\overline{v})$

plus some congruence rules...

CIS 500, 1-3 December 34 CIS 500, 1-3 December

35

$$\frac{t_0 \longrightarrow t'_0}{t_0.f \longrightarrow t'_0.f}$$
 (E-FIELD)

$$\frac{\mathtt{t_0} \longrightarrow \mathtt{t_0'}}{\mathtt{t_0.m(\overline{\mathtt{t}})} \longrightarrow \mathtt{t_0'.m(\overline{\mathtt{t}})}} \tag{E-INVK-RECV)}$$

$$\frac{\mathtt{t_i} \longrightarrow \mathtt{t_i'}}{\mathtt{v_0.m}(\overline{\mathtt{v}},\ \mathtt{t_i},\ \overline{\mathtt{t}}) \longrightarrow \mathtt{v_0.m}(\overline{\mathtt{v}},\ \mathtt{t_i'},\ \overline{\mathtt{t}})} \tag{E-Invk-Arg)}$$

$$\frac{\mathtt{t_i} \longrightarrow \mathtt{t_i'}}{\mathtt{new} \ \mathtt{C}(\overline{\mathtt{v}}, \ \mathtt{t_i}, \ \overline{\mathtt{t}}) \longrightarrow \mathtt{new} \ \mathtt{C}(\overline{\mathtt{v}}, \ \mathtt{t_i'}, \ \overline{\mathtt{t}})} \tag{E-New-Arg)}$$

$$\frac{\mathsf{t_0} \longrightarrow \mathsf{t_0'}}{(\mathsf{C})\mathsf{t_0} \longrightarrow (\mathsf{C})\mathsf{t_0'}}$$
 (E-CAST)

Typing

Notes

FJ has no rule of subsumption (because we want to follow Java). The typing rules are algorithmic.

(Where would this make a difference?...)

Typing rules

$$\frac{\mathbf{x}:C \in \Gamma}{\Gamma \vdash \mathbf{x}:C} \tag{T-VAR}$$

CIS 500, 1-3 December

38

CIS 500, 1-3 December

Typing rules

$$\frac{\Gamma \vdash \mathtt{t_0} \, : \, \mathtt{C_0} \qquad \text{fields}(\mathtt{C_0}) = \overline{\mathtt{C}} \ \overline{\mathtt{f}}}{\Gamma \vdash \mathtt{t_0} \, . \, \mathtt{f_i} \, : \, \mathtt{C_i}}$$

(T-FIELD)

Typing rules

$$\frac{\Gamma \vdash t_0 : D \quad D <: C}{\Gamma \vdash (C)t_0 : C}$$
 (T-UCAST)

$$\frac{\Gamma \vdash t_0 : D \quad C <: D \quad C \neq D}{\Gamma \vdash (C)t_0 : C}$$
 (T-DCAST)

Why two cast rules?

40

Typing rules

$$\frac{\Gamma \vdash t_0 : D \quad D <: C}{\Gamma \vdash (C)t_0 : C}$$
 (T-UCAST)

$$\frac{\Gamma \vdash t_0 : D \quad C <: D \quad C \neq D}{\Gamma \vdash (C)t_0 : C}$$
 (T-DCAST)

Why two cast rules? Because that's how Java does it!

CIS 500, 1-3 December

41-a

Typing rules

$$\begin{split} &\Gamma \vdash t_0 \,:\, C_0 \\ &\text{mtype}(\textbf{m},C_0) = \overline{\textbf{D}} \!\!\to\!\! \textbf{C} \\ &\frac{\Gamma \vdash \overline{\textbf{t}} \,:\, \overline{\textbf{C}} \quad \overline{\textbf{C}} \,<:\, \overline{\textbf{D}}}{\Gamma \vdash t_0 \,.\, \textbf{m}(\overline{\textbf{t}}) \,:\, \textbf{C}} \end{split} \tag{T-Invk}$$

Note that this rule "has subsumption built in" — i.e., the typing relation in FJ is written in the algorithmic style of TAPL chapter 16, not the declarative style of chapter 15.

Why? Because Java does it this way!

Typing rules

$$\begin{split} \Gamma &\vdash \mathtt{t}_0 \, : \, \mathtt{C}_0 \\ \textbf{mtype}(\mathtt{m}, \mathtt{C}_0) &= \overline{\mathtt{D}} \!\!\to \!\! \mathtt{C} \\ \frac{\Gamma \vdash \overline{\mathtt{t}} \, : \, \overline{\mathtt{C}} \qquad \overline{\mathtt{C}} \, <: \, \overline{\mathtt{D}}}{\Gamma \vdash \mathtt{t}_0 \, . \mathtt{m}(\overline{\mathtt{t}}) \, : \, \mathtt{C}} \end{split} \tag{T-Invk}$$

Note that this rule "has subsumption built in" — i.e., the typing relation in FJ is written in the algorithmic style of TAPL chapter 16, not the declarative style of chapter 15.

CIS 500, 1-3 December 42

Typing rules

$$\begin{split} &\Gamma \vdash t_0 \,:\, C_0 \\ &\text{mtype}(\textbf{m},C_0) = \overline{\textbf{D}} \!\!\to\!\! \textbf{C} \\ &\frac{\Gamma \vdash \overline{\textbf{t}} \,:\, \overline{\textbf{C}} \quad \overline{\textbf{C}} \,<:\, \overline{\textbf{D}}}{\Gamma \vdash t_0 \,.m(\overline{\textbf{t}}) \,:\, \textbf{C}} \end{split} \tag{T-Invk}$$

Note that this rule "has subsumption built in" — i.e., the typing relation in FJ is written in the algorithmic style of TAPL chapter 16, not the declarative style of chapter 15.

Why? Because Java does it this way!

But why does Java do it this way??

CIS 500, 1-3 December

Java typing is algorithmic

The Java typing relation is defined in the algorithmic style, for (at least) two reasons:

- 1. In order to perform static overloading resolution, we need to be able to speak of "the type" of an expression
- 2. We would otherwise run into trouble with typing of conditional expressions

Let's look at the second in more detail...

CIS 500, 1-3 December

CIS 500, 1-3 December

Java conditionals

 $\frac{t_1 \in bool \quad t_2 \in T_2 \quad t_3 \in T_3}{t_1 \ ? \ t_2 \ : \ t_3 \in ?}$

Java typing must be algorithmic

We haven't included them in FJ, but full Java has both interfaces and conditional expressions.

The two together actually make the declarative style of typing rules unworkable!

44

Java conditionals

 $\frac{t_1 \in bool \quad t_2 \in T_2 \quad t_3 \in T_3}{t_1 ? t_2 : t_3 \in ?}$

Actual Java rule (algorithmic):

 $\frac{t_1 \in bool}{t_1 ? t_2 : t_3 \in min(T_2, T_3)}$

More standard (declarative) rule:

```
\frac{t_1 \in bool \quad t_2 \in T \quad t_3 \in T}{t_1 ? t_2 : t_3 \in T}
```

CIS 500, 1-3 December

More standard (declarative) rule:

$$\frac{t_1 \in bool \quad t_2 \in T \quad t_3 \in T}{t_1 ? t_2 : t_3 \in T}$$

Algorithmic version:

$$\frac{t_1 \in bool}{t_1 ? t_2 : t_3 \in T_2 \lor T_3}$$

Requires joins!

CIS 500, 1-3 December 46-a

Java has no joins

But, in full Java (with interfaces), there are types that have no join! E.g.:

```
interface I {...}
interface J {...}
interface K extends I,J {...}
interface L extends I,J {...}
```

K and L have no join (least upper bound) — both I and J are common upper bounds, but neither of these is less than the other.

So: algorithmic typing rules are really our only option.

FJ Typing rules

$$\begin{split} & \text{fields}(\mathtt{C}) = \overline{\mathtt{D}} \ \ \overline{\mathtt{f}} \\ & \frac{\Gamma \vdash \overline{\mathtt{t}} : \overline{\mathtt{C}} \quad \overline{\mathtt{C}} \mathrel{<:} \overline{\mathtt{D}}}{\Gamma \vdash \mathtt{new} \ \mathtt{C}(\overline{\mathtt{t}}) : \mathtt{C}} \end{split} \tag{T-New}$$

CIS 500, 1-3 December 47 CIS 500, 1-3 December 48

Typing rules (methods, classes)

```
\begin{tabular}{llll} $\overline{x}:\overline{C}$, this: $C\vdash t_0: E_0 & E_0 <: C_0 \\ $CT(C)=$ class $C$ extends $D$ {...} \\ & & override(m,D,\overline{C}{\to}C_0) \\ \hline $C_0$ m $(\overline{C}$ $\overline{x}$) {return $t_0$;} 0K in $C$ \\ \hline $K=C(\overline{D}$ $\overline{g}$, $\overline{C}$ $\overline{f}$) {super($\overline{g}$); this.} $\overline{f}$ = $\overline{f}$;} \\ & & fields(D)=$\overline{D}$ $\overline{g}$ $\overline{M}$ 0K in $C$ \\ \hline & class $C$ extends $D$ {$\overline{C}$ $\overline{f}$; $K$ $\overline{M}$} 0K$ \\ \hline \end{tabular}
```

Properties

Preservation?

Surprise: well-typed programs can step to ill-typed ones! (How?)

(A)(Object)new B() \longrightarrow (A)new B()

Solution: "Stupid Cast" typing rule

Add another typing rule, marked "stupid" to

 $\frac{\Gamma \vdash t_0 : D \quad C \not < D \quad D \not < C}{\text{stupid warning}}$ $\frac{\Gamma \vdash (C)t_0 : C}{\Gamma \vdash (C)t_0 : C}$

(T-SCAST)

CIS 500, 1-3 December

52-b

52

CIS 500, 1-3 December

Solution: "Stupid Cast" typing rule

Add another typing rule, marked "stupid" to

$$\frac{\Gamma \vdash t_0 : D \quad C \not< D \quad D \not< C}{\text{stupid warning}}$$

$$\frac{\Gamma \vdash (C)t_0 : C}{\Gamma \vdash (C)t_0 : C}$$
(T-SCAST)

This is an example of a modeling technicality; not very interesting or deep, but we have to get it right if we're going to claim that the model is an accurate representation of (this fragment of) Java.

CIS 500, 1-3 December 53-a

Alternative approaches to casting

- ♦ Loosen preservation theorem
- ♦ Use big-step semantics

Correspondence with Java

Let's try to state precisely what we mean by "FJ corresponds to Java":

Claim:

- 1. Every syntactically well-formed FJ program is also a syntactically well-formed Java program.
- 2. A syntactically well-formed FJ program is typable in FJ (without using the T-SCAST rule.) iff it is typable in Java.
- 3. A well-typed FJ program behaves the same in FJ as in Java. (E.g., evaluating it in FJ diverges iff compiling and running it in Java diverges.)

Of course, without a formalization of full Java, we cannot prove this claim. But it's still very useful to say precisely what we are trying to accomplish—in particular, it provides a rigorous way of judging counterexamples.

(Cf. "conservative extension" between logics.)

CIS 500, 1-3 December 54

Progress

CIS 500, 1-3 December 55 CIS 500, 1-3 December 5

Progress

Problem: well-typed programs can get stuck.

How?

CIS 500, 1-3 December

Formalizing Progress

Solution: Weaken the statement of the progress theorem to

A well-typed FJ term is either a value or can reduce one step or is stuck at a failing cast.

Formalizing this takes a little more work...

Progress

Problem: well-typed programs can get stuck.

How?

Cast failure:

(A)new Object()

CIS 500, 1-3 December 56-b

Evaluation Contexts

Evaluation contexts capture the notion of the "next subterm to be reduced," in the sense that, if $t \longrightarrow t'$, then we can express t and t' as t = E[r] and t' = E[r'] for a unique E, r, and r', with $r \longrightarrow r'$ by one of the computation rules E-PROJNEW, E-INVKNEW, or E-CASTNEW.

56-a

Progress

Theorem [Progress]: Suppose t is a closed, well-typed normal form. Then either (1) t is a value, or (2) t \longrightarrow t' for some t', or (3) for some evaluation context E, we can express t as t = E[(C) (new D(\overline{v}))], with D $\not <$ C.

CIS 500, 1-3 December
