8	
Total (120 max)	

This exam includes material on the Imp language and the simply-typed lambda calculus. Some of the key definitions are repeated, for easy reference, in the accompanying handout. The version of Imp we consider in this exam only has arithmetic expressions that reduce to numbers; you don't need to worry about lists.

1. (12 points) Recall the fold function in Coq:

```
Fixpoint fold {X Y:Type} (f: X->Y->Y) (1:list X) (b:Y) : Y :=
  match l with
  | nil => b
  | h :: t => f h (fold f t b)
  end.
```

Use the function fold to complete the definitions of the following Coq functions. Your solutions should not use Fixpoint.

(a) A function that sums all the elements of 11: list nat; for example, if we apply the function you define to the list [1,4,3] it should return 8.

```
Definition f1 (l1:list nat) : nat :=
```

(b) A function that returns true iff at least one of the elements of 12: list bool is true; if we apply the function you define to [true,false,true] it should return true, while if we apply it to [false,false] or [] it should return false.

```
Definition f2 (12:list bool) : bool :=
```

(c) A function that behaves the same as map (the standard definition of map is repeated on page 14, for reference).

```
Definition map' {X Y:Type} (f:X->Y) (l:list X) : (list Y) :=
```

2. (12 points) Recall that Coq represents proofs internally as proof-objects — terms whose type is the proposition under consideration. For example, here is the proof object for the proposition for all A B : Prop, A $\land \land$ B \rightarrow A:

```
fun (A B : Prop) (H : A /\ B) =>
  match H with
  | conj HA HB => HA
  end.
```

Note the use of match to destruct the given proof object H.

Prove the following claims by providing proof objects as evidence. (For reference, the definitions of the logical connectives and and or are provided on page 15.)

(a) forall A B C : Prop, (A $/\setminus$ B -> C) -> A -> B -> C.

(b) forall A B C : Prop, (A \rightarrow B \rightarrow C) \rightarrow A $/\setminus$ B \rightarrow C.

- 3. (12 points) Each part of this question makes a general claim about program equivalences in Imp. For each one, indicate whether it is *true* or *false*. If it is false, give a counter-example. (For reference, the definition of program equivalence is provided on page 17.)
 - (a) For all commands c and boolean expressions b,

```
cequiv (WHILE b DO c END)
          (IF b THEN c ELSE SKIP FI; WHILE b DO c END)
```

(b) For all arithmetic expressions e1 and e2,

(c) For all boolean expressions b1 and b2 so that bequiv b1 BTrue and bequiv b2 BFalse,

```
cequiv (WHILE b1 D0 (WHILE b2 D0 SKIP END) END) (WHILE b2 D0 (WHILE b1 D0 SKIP END) END)
```

4. (10 points) Indicate whether or not each of the following Hoare triples is valid by writing either "valid" or "invalid" next to it. Also, for those that are invalid, give a counter-example. (The definition of valid Hoare triples is given on page 18, for reference.)

```
(a) \{\{X = 0\}\}\ Y ::= X \{\{X = 0\}\}\}
```

```
(b) {{ True }} X ::= Y + 1 {{ X <> 0 }}
```

```
(c) {{ True }} X := Y - 1 {{ X <> 0 }}
```

```
(d) {{ True }} X ::= a {{ X = a }}
```

(Note that the variable a represents an arbitrary aexp – i.e., you should write "valid" only if the triple is valid for every a. If you give a counter-example, make sure it includes a specific arithmetic expression a.)

5. (20 points) The following Imp program calculates the integer division and remainder of two numbers a and b.

```
X ::= a;
Y ::= b;
Z ::= 0;
WHILE Y <= X DO
    X ::= X - Y;
    Z ::= Z + 1
END</pre>
```

Note that we're using informal notations as usual in Imp examples, for example writing this...

```
WHILE (Y <= X)
```

...instead of this:

```
WHILE (BLe (AId Y) (AId X))
```

On the next page, add appropriate annotations to the program in the provided spaces to show that the Hoare triple given by the outermost pre- and post-conditions is valid. Use informal notations for mathematical formulae and assertions, but please be completely precise and pedantic in the way you apply the Hoare rules — i.e., write out assertions in *exactly* the form given by the rules (rather than logically equivalent ones). The provided blanks have been constructed so that, if you work backwards from the end of the program, you should only need to use the rule of consequence in the places indicated with =>.

The Hoare logic rules and the guidelines for decorated programs are provided on page 18, for reference.

{{ True }} => **{{** }} X ::= a; {{ }} Y ::= b; **{**{ }} Z ::= 0; {{ }} WHILE Y <= X DO {{ }} => {{ }} X ::= X - Y;{{ }} Z ::= Z + 1 {{ }} END; {{ }} =>

 $\{\{ b * Z + X = a / b > X \}\}$

6. (20 points) Consider the simply typed lambda-calculus with booleans and the fixed-point operator fix. (You can find the syntax, typing rules, and small-step evaluation rules for this language beginning on page 21.) The *progress* theorem for this language can be stated as follows:

Theorem: If $\vdash t : T$, then either t is a value or it can take a step.

Fill in the blanks in the following proof.

Proof: By induction on the given typing derivation.

- The last rule of the derivation cannot be T_Var, since a variable is never well typed in an empty context.
- The T_True and T_False cases are trivial, since in each of these cases we know immediately that t is a value.
- (The case where the last rule in the derivation is T_If is omitted for brevity.)
- If the last rule of the derivation is T_Abs, then ...

• If the last rule of the derivation is T_App, then ...

Continued on next page...

 \bullet If the last rule of the derivation is $\texttt{T_Fix},$ then \dots

7. (20 points) In this exercise we investigate how the properties of the simply-typed lambda
calculus with fix (the same language as in the previous problem) would change if we added new
rules to the small-step reduction relation or to the typing relation. For each of the properties, either
write "remains true" or else write "becomes false" and give a counterexample.

(a) Suppose we add the following new rule to the reduction	(a	ion relatioi	\mathbf{n} :
--	----	--------------	----------------

Which of the following properties remain true in the presence of this rule? (Remember to give counterexamples for the ones that do not.)

• Determinism of step (==>)

 \bullet Progress

(b)	Suppose inste	ad that w	ve add th	ne following	two new	rules to	o the	reduction	relation:
(\sim	Duppose more	aa ona w	o add or	10 10110 111115	OWO HOW	I dieb o	0110	reaccion	i ciadioii.

Which of the following properties remain true in the presence of these rules?

• Determinism of step (==>)

• Progress

(2)	Suppose	instead	that	we	add	the	fol	lowing	new	rule	to	the	typing	rela	ation:
Ι,	~)	Duppose	moudad	unau	WC	aaa	UIIC	101	10 11115	110 00	raic	UU	UIIC	y pmg	1010	toron.

Which of the following properties remain true in the presence of this rule?

• Determinism of step (==>)

• Progress

1	(A)	Suppose	bbe aw	the	following	now	rula	to	the	typing	relation	٠.
((a)	Suppose	we add	tne	IOHOWING	new	ruie	to	tne	typing	relation	1:

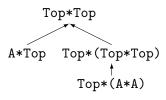

$$\begin{array}{l} \Gamma \, \vdash \, \text{t1 : Bool} \\ ----- \\ \Gamma \, \vdash \, \text{fix t1 : Bool} \end{array} \hspace{0.5cm} \text{(T_{punnyFix})}$$

Which of the following properties remain true in the presence of this rule?

• Determinism of step (==>)

• Progress

8. (14 points) The subtyping relations among a collection of types can be visualized compactly in picture form: we draw a graph so that S <: T iff we can get from S to T by following arrows in the graph (either directly or indirectly). For example, a picture for the types Top*Top, A*Top, Top*(Top*Top), and Top*(A*A) would look like this (it actually happens to form a tree):

Suppose we have defined types Student and Person so that Student <: Person. Draw a picture for the following six types.

Student -> Person
Top
Student -> Top
Person -> Student
Top -> Student
Top -> Top -> Person

The map function

Definitions of logical connectives in Coq

```
Inductive and (P Q : Prop) : Prop :=
  conj : P -> Q -> (and P Q).

Inductive or (P Q : Prop) : Prop :=
  | or_introl : P -> or P Q
  | or_intror : Q -> or P Q.

Notation "P /\ Q" := (and P Q) : type_scope.
Notation "P \/ Q" := (or P Q) : type_scope.
```

Formal definitions for Imp

Syntax

```
Inductive aexp : Type :=
  | ANum : nat -> aexp
  | AId : id -> aexp
  | APlus : aexp -> aexp -> aexp
  | AMinus : aexp -> aexp -> aexp
  | AMult : aexp -> aexp -> aexp.
Inductive bexp : Type :=
  | BTrue : bexp
  | BFalse : bexp
  | BEq : aexp -> aexp -> bexp
  | BLe : aexp -> aexp -> bexp
  | BNot : bexp -> bexp
  | BAnd : bexp -> bexp -> bexp.
Inductive com : Type :=
  | CSkip : com
  | CAss : id -> aexp -> com
  | CSeq : com -> com -> com
  | CIf : bexp -> com -> com -> com
  | CWhile : bexp -> com -> com.
Notation "'SKIP'" :=
  CSkip.
Notation "X '::=' a" :=
  (CAss X a) (at level 60).
Notation "c1; c2" :=
  (CSeq c1 c2) (at level 80, right associativity).
Notation "'WHILE' b 'DO' c 'END'" :=
  (CWhile b c) (at level 80, right associativity).
Notation "'IFB' e1 'THEN' e2 'ELSE' e3 'FI'" :=
  (CIf e1 e2 e3) (at level 80, right associativity).
```

Evaluation relation

```
Inductive ceval : com -> state -> state -> Prop :=
      | E_Skip : forall st,
          SKIP / st || st
      | E_Ass : forall st a1 n X,
          aeval st a1 = n \rightarrow
          (X ::= a1) / st || (update st X n)
      | E_Seq : forall c1 c2 st st' st'',
          c1 / st || st' ->
          c2 / st' || st'' ->
          (c1; c2) / st || st''
      | E_IfTrue : forall st st' b1 c1 c2,
          beval st b1 = true ->
          c1 / st || st' ->
          (IFB b1 THEN c1 ELSE c2 FI) / st || st'
      | E_IfFalse : forall st st' b1 c1 c2,
         beval st b1 = false ->
          c2 / st || st' ->
          (IFB b1 THEN c1 ELSE c2 FI) / st || st'
      | E_WhileEnd : forall b1 st c1,
          beval st b1 = false ->
          (WHILE b1 DO c1 END) / st || st
      | E_WhileLoop : forall st st' st'' b1 c1,
          beval st b1 = true ->
          c1 / st || st' ->
          (WHILE b1 D0 c1 END) / st' || st'' ->
          (WHILE b1 DO c1 END) / st || st''
     where "c1 '/' st '||' st'" := (ceval c1 st st').
Program equivalence
   Definition bequiv (b1 b2 : bexp) : Prop :=
     forall (st:state), beval st b1 = beval st b2.
   Definition cequiv (c1 c2 : com) : Prop :=
     forall (st st': state),
        (c1 / st || st') <-> (c2 / st || st').
```

Hoare triples

Implication on assertions

```
Definition assert_implies (P Q : Assertion) : Prop :=
  forall st, P st → Q st.
Notation "P → Q" := (assert_implies P Q) (at level 80).
```

Hoare logic rules

Decorated programs

A decorated program consists of the program text interleaved with assertions. To check that a decorated program represents a valid proof, we check that each individual command is *locally* consistent with its accompanying assertions in the following sense:

• SKIP is locally consistent if its precondition and postcondition are the same:

```
\{\{P\}\} SKIP \{\{P\}\}
```

• The sequential composition of commands c1 and c2 is locally consistent (with respect to assertions P and R) if c1 is locally consistent (with respect to P and Q) and c2 is locally consistent (with respect to Q and R):

```
\{\{P\}\}\ c1; \{\{Q\}\}\ c2 \{\{R\}\}
```

• An assignment is locally consistent if its precondition is the appropriate substitution of its postcondition:

```
 \{ \{ \ P \ \text{where a is substituted for X } \} \\ \mathbf{X} \ ::= \mathbf{a} \\ \{ \{ \ P \ \} \}
```

• A conditional is locally consistent (with respect to assertions P and Q) if the assertions at the top of its "then" and "else" branches are exactly $P \wedge b$ and $P \wedge \sim b$ and if its "then" branch is locally consistent (with respect to $P \wedge b$ and Q) and its "else" branch is locally consistent (with respect to $P \wedge \sim b$ and Q):

```
 \begin{array}{ll} \{\{\ P\ \}\} \\ \text{IFB b THEN} \\ \{\{\ P\ \land\ \mathsf{b}\ \}\} \\ \text{c1} \\ \{\{\ Q\ \}\} \\ \text{ELSE} \\ \{\{\ P\ \land\ \sim\!\mathsf{b}\ \}\} \\ \text{c2} \\ \{\{\ Q\ \}\} \\ \text{FI} \\ \{\{\ Q\ \}\} \end{array}
```

• A while loop is locally consistent if its postcondition is $P \land \sim b$ (where P is its precondition) and if the pre- and postconditions of its body are exactly $P \land b$ and P:

```
 \begin{cases} \{P\} \} \\ \text{WHILE b DO} \\ \{ \{P \land \text{b} \} \} \\ \text{c1} \\ \{ \{P\} \} \end{cases}   \text{END} \\ \{ \{P \land \sim \text{b} \} \}
```

- A pair of assertions separated by => is locally consistent if the first implies the second (in all states):
 - $\{ \{ P \} \} \Rightarrow$ $\{ \{ Q \} \}$
