

Lecture #5 – Anti-Aliasing

**ESE 150 – DIGITAL AUDIO BASICS**

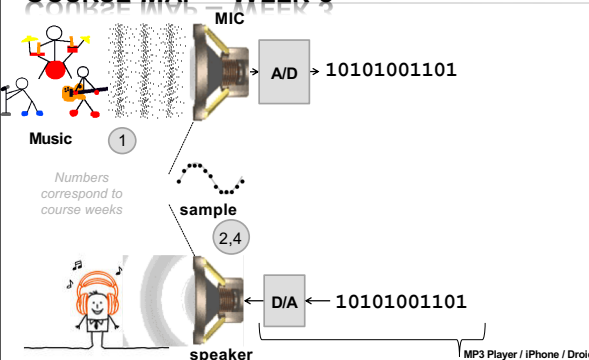

Based on slides © 2009–2021 DeHon and Koditschek  
Additional Material © 2014 Farmer

### LECTURE TOPICS

- × Where are we on course map?
- × **Review**
  - + Nyquist-Shannon Sampling Rate
  - + Aliasing
- × **Multi-frequency signals**
- × **Anti-Alias Filtering**
- × References

2

### COURSE MAP – WEEK 3

Music (1) → MIC → A/D → 10101001101

sample (2,4)

D/A ← 10101001101 → speaker

MP3 Player / iPhone / Droid

Numbers correspond to course weeks

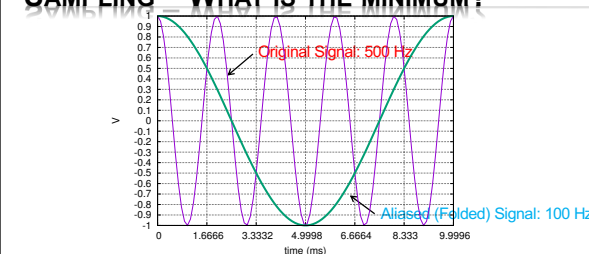

3

### NYQUIST SAMPLING

- × **Sample at twice the maximum frequency**
  - + Can reconstruct perfectly
- × **If have frequencies > SampleRate/2**
  - + Will get aliasing ... as high frequencies fold

4

### SAMPLING – WHAT IS THE MINIMUM?

Original Signal: 500 Hz

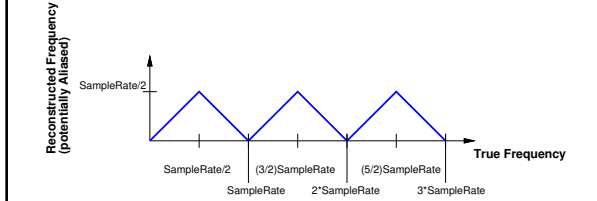

Aliased (Folded) Signal: 100 Hz

- × **What frequency does aliasing occur?**
  - + Original Signal's Frequency: 500 Hz
  - + Sampling Rate: 600 Hz
  - + Aliasing occurs at:  $600 \text{ Hz} - 500 \text{ Hz} = 100 \text{ Hz}$
  - Also referred to as "Folding" – signal has "folds over" as if it were lower frequency

5

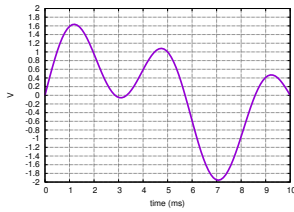

### SAMPLING – WHAT IS THE MINIMUM?

- × **Generalize**
  - +  $F' = \text{frequency mod SampleRate}$  (subtract out integer  $2\pi$  terms)
  - + Alias frequency is
    - ×  $F'$  if  $F' < \text{SampleRate}/2$
    - ×  $\text{SampleRate} - F'$  if  $\text{SampleRate}/2 < F' < \text{SampleRate}$

6

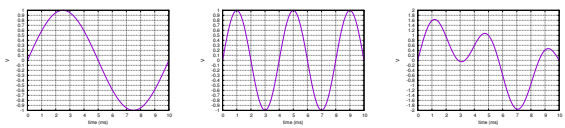

## WHAT ABOUT MULTIRATE SIGNALS?

- × **Fourier's Theorem (week 4 preview!):**
  - + We can decompose continuous signal in terms of a sum of sines and cosines at different frequencies

7

## PRECLASS 1

	0	1	2	3	4	5	6	7	8	9	10	f
L												
M												
R												

Properly sampled? Relation?

8

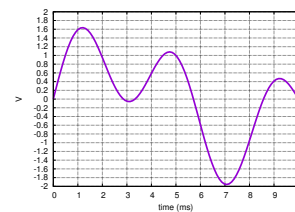

## WHAT ABOUT MULTIRATE SIGNALS?

- × **Fourier's Theorem (week 4 preview!):**
  - + We can decompose continuous signal in terms of a sum of sines and cosines at different frequencies
  - + This waveform: sum of sine waves at 100Hz and 250Hz
    - What's the Nyquist Sampling Rate then?

9

## WHAT ABOUT MULTIRATE SIGNALS?

- × **Fourier's Theorem & Nyquist Rate:**
  - + Highest component's frequency?
  - + What is Nyquist Sampling Rate?
    - × 2 x highest frequency contained in the signal
    - × Sampling at this rate: avoids aliasing problem

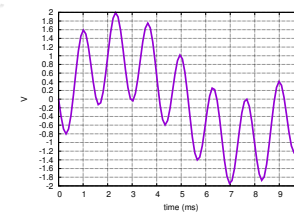

10

## EFFECTS OF ALIASING

11

## ALIASING IN MUSIC...

Preclass 2

- × **Multirate Signals and Aliasing**
  - + Imagine the above is a music signal (100Hz + 750Hz)
    - × What happens if we undersample? Should sample at 1500 Hz, but instead 1000 Hz
    - × The 100 Hz signal will be sampled just fine (as 200 Hz is 2 x 100 Hz)
    - × What happens to 750 Hz Signal?

12

## ALIASING IN MUSIC...

- × **Multirate Signals and Aliasing**
  - + Imagine the above is a music signal (100 Hz and 750 Hz chord)
  - + **Where will 750Hz appear as?**
    - × folding occurs at:  $1000 \text{ Hz} - 750 \text{ Hz} = 250 \text{ Hz}$
    - ×  $\text{Sample rate} - \text{frequency} = \text{aliasing/folding frequency}$

13

## ANTI-ALIASING

14

## HOW DO WE FIX THIS?

- × **It's simple...sample at the Nyquist Rate**
  - + But...what if your rate is fixed? Like 24 frames/sec?
  - + Or our eye's sampling rate: 60 cycles/degree
    - × Spatial variations finer than this are undetectable!

15

## WHY DO WE NEED THE ANTIALIAS FILTER?

- × **If we can't hear anything above 20kHz...**
  - + Why do we need to filter it out?
    - × Dog's can hear from 40 Hz to 60 kHz
      - × so clearly there are sounds above 20 kHz
  - + Let's imagine a high frequency noise in music studio
    - × Let's say it's a vibration occurring at 25 kHz
      - × No human can hear it, why filter it out?
    - × Because of aliasing:
      - × Frequency aliasing/folding will occur:
        - ×  $\text{Sample rate} - \text{frequency} = \text{aliasing/folding frequency}$
        - ×  $40 \text{ kHz} - 25 \text{ kHz} = 15 \text{ kHz}$
        - × The 25 kHz vibration will fold-over to a 15 kHz "hum" or audible noise
          - × It will ruin our recording and source of noise wouldn't be obvious!

16

## HOW TO AVOID ALIASING WITH DIGITAL MUSIC?

- × **If we simply sample at 2 x highest frequency of signal...**
  - + (AKA: Nyquist Rate)
  - + ...we won't encounter aliasing!
- × **But how do we guarantee highest frequency of our signal?**
  - + Audio: this is easy!
    - × We know the range of human ear: 20 Hz to 20 kHz...
    - × The highest frequency component in music is then: 20 kHz
    - × ...so, before sound goes into ADC, we apply a filter!
      - × Blocks any frequency above 20 kHz from going into ADC
    - × Essentially, we are fixing our sampling rate & 'blurring' or filtering our incoming signal

17

## WE KNOW HOW TO AVOID ALIASING...

- × **What is a filter you ask?**
  - + Imagine a coffee filter...
    - Water, Ground coffee beans go into Filter...
    - Coffee Filter →
    - Only "delicious" coffee passes through filter... "grinds" cannot pass
  - Signals ranging in frequencies from 20Hz to 40kHz go into filter
  - Called a "low pass" filter Has a "cutoff" frequency of 20 kHz
  - Only "delicious" signals ranging from 20Hz to 20kHz pass through filter (aka Audio Signals)

18

### LOW PASS ANALOG FILTERING

- × Can limit rate of change
  - + Set a minimum time period for a value to charge output
- × If signal tries to move too fast (high frequency)
  - + The input change won't be reflected in the output
- × Ideal: fast inputs "erased" from output
- × In practice: magnitude reduced
- × Can engineer filters to get closer to ideal 215, 319

19

### LOW PASS ANALOG FILTERING

- × Transfer  $V_{in}$  into Capacitor  $V_{out}$
- × Think of Resistor as straw or hose
  - + Limits rate of electron flow into Capacitor
- × Think of Capacitor as a glass or bucket
  - + Must fill with electrons through Resistor to have Voltage (water) level rise
- × Circuit limits rate of change time at  $V_{out}$

Resistor-Capacitor

20

### FREQUENCY AND SIGNAL CHANGE

- × There's a direct relationship between frequency of a signal and rate at which signal changes
  - + Higher frequency → higher  $\Delta V / \Delta T$
  - + Limit rise time → limit frequency can pass through filter
  - + Maximum frequency → limits the rise-time will have
    - Will rise over 1/2 of the period

21

### FULL BLOCK DIAGRAM OF DSP SYSTEM

- × Before ADC, we put music signal through **antialias filter**
  - + Filter blocks any signals higher than 20 kHz (prevents aliasing!)

Figures from reading: *The Scientist and Engineer's Guide to Digital Signal Processing*, By Steven W. Smith

22

### FULL BLOCK DIAGRAM OF DSP SYSTEM

- × Before ADC, we put music signal through **antialias filter**
  - + Filter blocks any signals higher than 20 kHz (prevents aliasing!)
  - + Then our ADC can safely sample at  $2 \times 20$  kHz without aliasing
    - What is our **Nyquist Rate**?
      - $f_s = 2 \times 20$  kHz = 40 kHz, or 40 thousand samples per second!
    - What is our **Nyquist Frequency**?
      - $\frac{1}{2} f_s = 20$  kHz
  - + Cutoff frequency of our filter? Has to be the Nyquist Frequency

23

### BIG IDEAS

- × **Sample at twice the maximum frequency**
  - + Can reconstruct perfectly
- × **If have frequencies > sample\_freq/2**
  - + Will get aliasing ... as high frequencies fold
- × **Avoid aliasing with analog Anti-Alias (low-pass) prefilter before sampling**
  - + Eliminate high frequencies

26

## LEARN MORE

- × ESE215 – include analog filtering
- × ESE319 – active analog filtering
- × ESE224 – Signal Processing

27

## ADMIN

- × **Remember feedback**
  - + Including on Lab 2
- × **Lab 3 posted**
  - + Prelab contains a longer MATLAB tutorial
    - × And need to install MATLAB
  - + Plan time for it over weekend

28
