2

Circular Convolution

- Circular Convolution:

$$x_1[n] \otimes x_2[n] \triangleq \sum_{m=0}^{N-1} x_1[m]x_2[((n-m))_N]$$

For two signals of length N

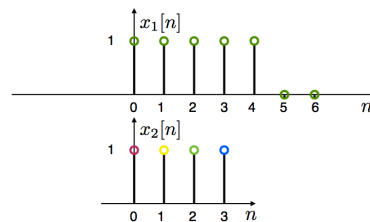

Note: Circular convolution is commutative

$$x_2[n] \otimes x_1[n] = x_1[n] \otimes x_2[n]$$

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

3

Compute Circular Convolution Sum

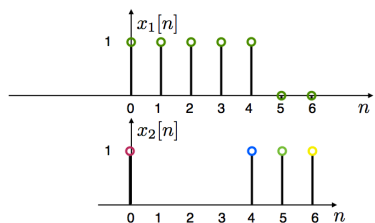

$$x_1[n] \otimes x_2[n] \triangleq \sum_{m=0}^{N-1} x_1[m]x_2[((n-m))_N]$$

10

Linear Convolution

- We start with two non-periodic sequences:

$$x[n] \quad 0 \leq n \leq L-1$$

$$h[n] \quad 0 \leq n \leq P-1$$

- E.g. $x[n]$ is a signal and $h[n]$ a filter's impulse response

- We want to compute the linear convolution:

$$y[n] = x[n] * h[n] = \sum_{m=0}^{L-1} x[m]h[n-m]$$

- $y[n]$ is nonzero for $0 \leq n \leq L+P-2$ with length $M=L+P-1$

Requires LP multiplications

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

11

Linear Convolution via Circular Convolution

- Zero-pad $x[n]$ by $P-1$ zeros

$$x_{zp}[n] = \begin{cases} x[n] & 0 \leq n \leq L-1 \\ 0 & L \leq n \leq L+P-2 \end{cases}$$

- Zero-pad $h[n]$ by $L-1$ zeros

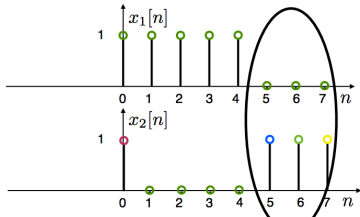

$$h_{zp}[n] = \begin{cases} h[n] & 0 \leq n \leq P-1 \\ 0 & P \leq n \leq L+P-2 \end{cases}$$

- Now, both sequences are length $M=L+P-1$

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

12

Example

Circular 'flip'

$$M = L + P - 1 = 8$$

$$y[n] = x_1[n] \otimes x_2[n] = x_1[n] * x_2[n]$$

Penn ESE 531 Spring 2017 - Khanna
Adapted from M. Lustig, EECS Berkeley

13

Circular Conv. as Linear Conv. w/ Aliasing

- If the DFT $X(e^{j\omega})$ of a sequence $x[n]$ is sampled at N frequencies $\omega_k = 2\pi k/N$, then the resulting sequence $X[k]$ corresponds to the periodic sequence

$$\tilde{x}[n] = \sum_{r=-\infty}^{\infty} x[n - rN].$$

- And $x[k] = \begin{cases} X(e^{j(2\pi k/N)}), & 0 \leq k \leq N-1, \\ 0, & \text{otherwise,} \end{cases}$ is the DFT of one period given as

$$x_p[n] = \begin{cases} \tilde{x}[n], & 0 \leq n \leq N-1, \\ 0, & \text{otherwise.} \end{cases}$$

Penn ESE 531 Spring 2017 - Khanna

14

Circular Conv. as Linear Conv. w/ Aliasing

$$x_p[n] = \begin{cases} \tilde{x}[n], & 0 \leq n \leq N-1, \\ 0, & \text{otherwise.} \end{cases}$$

- If $x[n]$ has length less than or equal to N , then $x_p[n] = x[n]$
- However if the length of $x[n]$ is greater than N , this might not be true and we get aliasing in time
 - N -point convolution results in N -point sequence

Penn ESE 531 Spring 2017 - Khanna

15

Circular Conv. as Linear Conv. w/ Aliasing

- Given two N -point sequences $x_1[n]$ and $x_2[n]$ and their N -point DFTs $X_1[k]$ and $X_2[k]$
- The N -point DFT of $x_3[n] = x_1[n] * x_2[n]$ is defined as

$$X_3[k] = X_3(e^{j(2\pi k/N)})$$

- And therefore $X_3[k] = X_1[k]X_2[k]$, where the inverse DFT of $X_3[k]$ is

$$x_{3p}[n] = \begin{cases} \sum_{r=-\infty}^{\infty} x_3[n - rN], & 0 \leq n \leq N-1, \\ 0, & \text{otherwise,} \end{cases}$$

Penn ESE 531 Spring 2017 - Khanna

16

Circular Conv. as Linear Conv. w/ Aliasing

$$x_{3p}[n] = \begin{cases} \sum_{r=-\infty}^{\infty} x_3[n - rN], & 0 \leq n \leq N-1, \\ 0, & \text{otherwise,} \end{cases}$$

- Therefore

$$x_{3p}[n] = x_1[n] \otimes x_2[n]$$

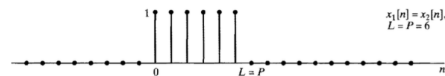

- The N -point circular convolution is the sum of linear convolutions shifted in time by N

Penn ESE 531 Spring 2017 - Khanna

17

31

Discrete Fourier Transform

- The DFT

$$x[n] = \frac{1}{N} \sum_{k=0}^{N-1} X[k] W_N^{-kn} \quad \text{Inverse DFT, synthesis}$$

$$X[k] = \sum_{n=0}^{N-1} x[n] W_N^{kn} \quad \text{DFT, analysis}$$

- It is understood that,

$$x[n] = 0 \quad \text{outside } 0 \leq n \leq N-1$$

$$X[k] = 0 \quad \text{outside } 0 \leq k \leq N-1$$

Penn ESE 531 Spring 2017 - Khanna
Adapted from M. Lustig, EECS Berkeley

32

DFT vs. DTFT

- The DFT are samples of the DTFT at N equally spaced frequencies

$$X[k] = X(e^{j\omega})|_{\omega=k\frac{2\pi}{N}} \quad 0 \leq k \leq N-1$$

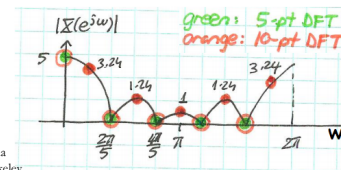

Penn ESE 531 Spring 2017 - Khanna
Adapted from M. Lustig, EECS Berkeley

33

DFT vs DTFT

- Back to example

$$X[k] = \sum_{n=0}^4 W_{10}^{nk} = e^{-j\frac{4\pi}{10}k} \frac{\sin(\frac{\pi}{2}k)}{\sin(\frac{\pi}{10}k)}$$

Penn ESE 531 Spring 2017 - Khanna
Adapted from M. Lustig, EECS Berkeley

34

Fast Fourier Transform Algorithms

- We are interested in efficient computing methods for the DFT and inverse DFT:

$$X[k] = \sum_{n=0}^{N-1} x[n] W_N^{kn}, \quad k = 0, \dots, N-1$$

$$x[n] = \sum_{k=0}^{N-1} X[k] W_N^{-kn}, \quad n = 0, \dots, N-1$$

$$W_N = e^{-j(\frac{2\pi}{N})}$$

Penn ESE 531 Spring 2017 - Khanna
Adapted from M. Lustig, EECS Berkeley

35

Eigenfunction Properties

- Most FFT algorithms exploit the following properties of W_N^{kn} :

- Conjugate Symmetry

$$W_N^{k(N-n)} = W_N^{-kn} = (W_N^{kn})^*$$

- Periodicity in n and k

$$W_N^{kn} = W_N^{k(n+N)} = W_N^{(k+N)n}$$

- Power

$$W_N^2 = W_{N/2}$$

Penn ESE 531 Spring 2017 - Khanna
Adapted from M. Lustig, EECS Berkeley

36

FFT Algorithms via Decimation

- Most FFT algorithms decompose the computation of a DFT into successively smaller DFT computations.
 - Decimation-in-time algorithms decompose $x[n]$ into successively smaller subsequences.
 - Decimation-in-frequency algorithms decompose $X[k]$ into successively smaller subsequences.
- We mostly discuss decimation-in-time algorithms today.
- Note: Assume length of $x[n]$ is power of 2 ($N = 2^r$). If not, zero-pad to closest power.

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

37

Decimation-in-Time FFT

- We start with the DFT

$$X[k] = \sum_{n=0}^{N-1} x[n] W_N^{kn}, \quad k = 0, \dots, N-1$$

- Separate the sum into even and odd terms:

$$X[k] = \sum_{n \text{ even}} x[n] W_N^{kn} + \sum_{n \text{ odd}} x[n] W_N^{kn}$$

- These are two DFTs, each with half the number of samples ($N/2$)

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

38

Decimation-in-Time FFT

Let $n = 2r$ (n even) and $n = 2r + 1$ (n odd):

$$\begin{aligned} X[k] &= \sum_{r=0}^{(N/2)-1} x[2r] W_N^{2rk} + \sum_{r=0}^{(N/2)-1} x[2r+1] W_N^{(2r+1)k} \\ &= \sum_{r=0}^{(N/2)-1} x[2r] W_N^{2rk} + W_N^k \sum_{r=0}^{(N/2)-1} x[2r+1] W_N^{2rk} \end{aligned}$$

$$X[k] = \sum_{r=0}^{(N/2)-1} x[2r] W_{N/2}^{rk} + W_N^k \sum_{r=0}^{(N/2)-1} x[2r+1] W_{N/2}^{rk}$$

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

39

Decimation-in-Time FFT

Hence:

$$\begin{aligned} X[k] &= \sum_{r=0}^{(N/2)-1} x[2r] W_{N/2}^{rk} + W_N^k \sum_{r=0}^{(N/2)-1} x[2r+1] W_{N/2}^{rk} \\ &\triangleq G[k] + W_N^k H[k], \quad k = 0, \dots, N-1 \end{aligned}$$

where we have defined:

$$G[k] \triangleq \sum_{r=0}^{(N/2)-1} x[2r] W_{N/2}^{rk} \Rightarrow \text{DFT of even samples}$$

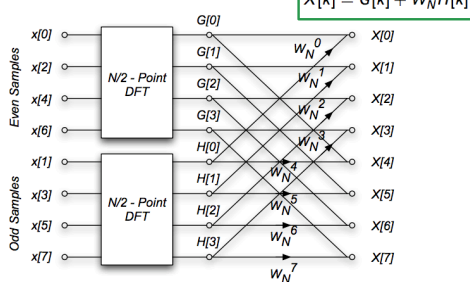

$$H[k] \triangleq \sum_{r=0}^{(N/2)-1} x[2r+1] W_{N/2}^{rk} \Rightarrow \text{DFT of odd samples}$$

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

40

Decimation-in-Time FFT

An 8 sample DFT can then be diagrammed as

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

41

Decimation-in-Time FFT

- So,

$$\begin{aligned} G[k + (N/2)] &= G[k] \\ H[k + (N/2)] &= H[k] \end{aligned}$$

- The periodicity of $G[k]$ and $H[k]$ allows us to further simplify. For the first $N/2$ points we calculate $G[k]$ and $W_N^k H[k]$, and then compute the sum

$$X[k] = G[k] + W_N^k H[k] \quad \forall \{k : 0 \leq k < \frac{N}{2}\}.$$

How does periodicity help for $\frac{N}{2} \leq k < N$?

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

42

Decimation-in-Time FFT

$$X[k] = G[k] + W_N^k H[k] \quad \forall \{k : 0 \leq k < \frac{N}{2}\}.$$

for $\frac{N}{2} \leq k < N$:

$$W_N^{k+(N/2)} = ?$$

$$X[k + (N/2)] = ?$$

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

43

Decimation-in-Time FFT

$$X[k] = G[k] + W_N^k H[k] \quad \forall \{k : 0 \leq k < \frac{N}{2}\}.$$

for $\frac{N}{2} \leq k < N$:

$$W_N^{k+(N/2)} = -1$$

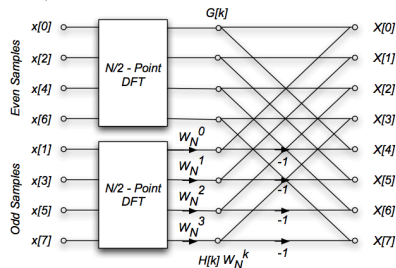

$$X[k + (N/2)] = G[k] - W_N^k H[k]$$

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

44

Decimation-in-Time FFT

The N -point DFT has been reduced two $N/2$ -point DFTs, plus $N/2$ complex multiplications. The 8 sample DFT is then:

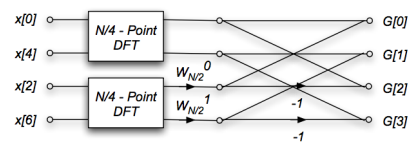

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

45

Decimation-in-Time FFT

□ We can use the same approach for each of the $N/2$ point DFT's. For the $N = 8$ case, the $N/2$ DFT's look like

*Note that the inputs have been reordered again.

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

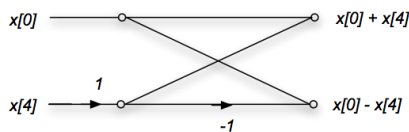

46

Decimation-in-Time FFT

□ At this point for the 8 sample DFT, we can replace the $N/4 = 2$ sample DFT's with a single butterfly. The coefficient is

$$W_{N/4} = W_{8/4} = W_2 = e^{-j\pi} = -1$$

The diagram of this stage is then

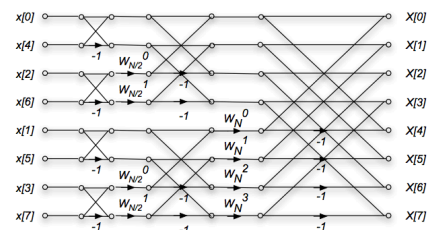

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

47

Decimation-in-Time FFT

Combining all these stages, the diagram for the 8 sample DFT is:

- $3 = \log_2(N) = \log_2(8)$ stages
- $4 = N/2 = 8/2$ multiplications in each stage
- 1st stage has trivial multiplication

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

48

Decimation-in-Time FFT

- In general, there are $\log_2 N$ stages of decimation-in-time.
- Each stage requires $N/2$ complex multiplications, some of which are trivial.
- The total number of complex multiplications is $(N/2) \log_2 N$, or $O(N \log_2 N)$

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

49

Decimation-in-Time FFT

- In general, there are $\log_2 N$ stages of decimation-in-time.
- Each stage requires $N/2$ complex multiplications, some of which are trivial.
- The total number of complex multiplications is $(N/2) \log_2 N$, or $O(N \log_2 N)$
- The order of the input to the decimation-in-time FFT algorithm must be permuted.
 - First stage: split into odd and even. Zero low-order bit (LSB) first
 - Next stage repeats with next zero-lower bit first.
 - Net effect is reversing the bit order of indexes

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

50

Decimation-in-Time FFT

This is illustrated in the following table for $N = 8$.

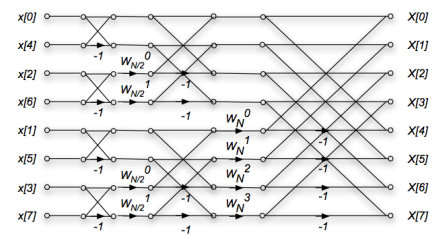

Decimal	Binary	Bit-Reversed Binary	Bit-Reversed Decimal
0	000	000	0
1	001	100	4
2	010	010	2
3	011	110	6
4	100	001	1
5	101	101	5
6	110	011	3
7	111	111	7

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

51

Decimation-in-Time FFT

Combining all these stages, the diagram for the 8 sample DFT is:

- $3 = \log_2(N) = \log_2(8)$ stages
- $4 = N/2 = 8/2$ multiplications in each stage
- 1st stage has trivial multiplication

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

52

Decimation-in-Frequency FFT

The DFT is

$$X[k] = \sum_{n=0}^{N-1} x[n] W_N^{nk}$$

If we only look at the even samples of $X[k]$, we can write $k = 2r$,

$$X[2r] = \sum_{n=0}^{N-1} x[n] W_N^{n(2r)}$$

We split this into two sums, one over the first $N/2$ samples, and the second of the last $N/2$ samples.

$$X[2r] = \sum_{n=0}^{(N/2)-1} x[n] W_N^{2rn} + \sum_{n=0}^{(N/2)-1} x[n + N/2] W_N^{2r(n+N/2)}$$

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

53

Decimation-in-Frequency FFT

$$\text{But } W_N^{2r(n+N/2)} = W_N^{2rn} W_N^{rN} = W_N^{2rn} = W_{N/2}^{rn}.$$

We can then write

$$\begin{aligned} X[2r] &= \sum_{n=0}^{(N/2)-1} x[n] W_N^{2rn} + \sum_{n=0}^{(N/2)-1} x[n + N/2] W_N^{2r(n+N/2)} \\ &= \sum_{n=0}^{(N/2)-1} x[n] W_N^{2rn} + \sum_{n=0}^{(N/2)-1} x[n + N/2] W_N^{2rn} \\ &= \sum_{n=0}^{(N/2)-1} (x[n] + x[n + N/2]) W_{N/2}^{rn} \end{aligned}$$

This is the $N/2$ -length DFT of first and second half of $x[n]$ summed.

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

54

Decimation-in-Frequency FFT

$$\begin{aligned} X[2r] &= \text{DFT}_{\frac{N}{2}} \{(x[n] + x[n + N/2])\} \\ X[2r + 1] &= \text{DFT}_{\frac{N}{2}} \{(x[n] - x[n + N/2]) W_N^n\} \end{aligned}$$

(By a similar argument that gives the odd samples)

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

55

Decimation-in-Frequency FFT

$$\begin{aligned} X[2r] &= \text{DFT}_{\frac{N}{2}} \{(x[n] + x[n + N/2])\} \\ X[2r + 1] &= \text{DFT}_{\frac{N}{2}} \{(x[n] - x[n + N/2]) W_N^n\} \end{aligned}$$

(By a similar argument that gives the odd samples)

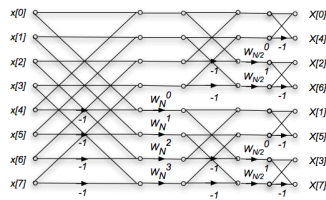

Continue the same approach is applied for the $N/2$ DFTs, and the $N/4$ DFT's until we reach simple butterflies.

Penn ESE 531 Spring 2017 – Khanna
Adapted from M. Lustig, EECS Berkeley

56

Decimation-in-Frequency FFT

The diagram for an 8-point decimation-in-frequency DFT is as follows

This is just the decimation-in-time algorithm reversed!
The inputs are in normal order, and the outputs are bit reversed.

Penn ESE 531 Spring 2017 – Khanna

57

Example 1:

A long *periodic* sequence x of period $N = 2^r$ (r is an integer) is to be convolved with a finite-length sequence h of length K .

(a) Show that the output y of this convolution (filtering) is *periodic*; what is its period?

Penn ESE 531 Spring 2017 – Khanna

58

Example 1:

A long *periodic* sequence x of period $N = 2^r$ (r is an integer) is to be convolved with a finite-length sequence h of length K .

(a) Show that the output y of this convolution (filtering) is *periodic*; what is its period?

(b) Let $K = mN$ where m is an integer; N is large. How would you implement this convolution *efficiently*? Explain your analysis clearly.

Compare the *total number of multiplications* required in your scheme to that in the direct implementation of FIR filtering. (Consider the case $r = 10$, $m = 10$).

Penn ESE 531 Spring 2017 – Khanna

59

Example 2:

A sequence $x = \{x[n], n = 0, 1, \dots, N-1\}$ is given; let $X(e^{j\omega})$ be its DTFT.

(a) Suppose $N = 10$. You want to evaluate both $X(e^{j2\pi 7/12})$ and $X(e^{j2\pi 3/8})$. The only computation you can perform is one DFT, on any one input sequence of your choice. Can you find the desired DTFT values? (Show your analysis and explain clearly.)

Penn ESE 531 Spring 2017 – Khanna

60

Example 2:

A sequence $x = \{x[n], n = 0, 1, \dots, N-1\}$ is given; let $X(e^{j\omega})$ be its DTFT.

- (a) Suppose $N = 10$. You want to evaluate both $X(e^{j2\pi 7/12})$ and $X(e^{j2\pi 3/8})$. The only computation you can perform is one DFT, on any one input sequence of your choice. Can you find the desired DTFT values? (*Show your analysis and explain clearly.*)

- (b) Suppose N is large. You want to obtain $X(e^{j\omega})$ at the following $2M$ frequencies:

$$\omega = \frac{2\pi}{M}m, \quad m = 0, 1, \dots, M-1 \quad \text{and} \quad \omega = \frac{2\pi}{M}m + \frac{2\pi}{N}, \quad m = 0, 1, \dots, M-1.$$

Here $M = 2^n \ll N = 2^r$

A standard radix-2 FFT algorithm is available. You may execute the FFT algorithm *once or more than once*, and *multiplications and additions* outside of the FFT are *allowed*, if necessary.

You want to get the $2M$ DTFT values with as few *total multiplications* as possible (*including those in the FFT*). Give explicitly the best method you can find for this, with an estimate of the *total number of multiplications* needed in terms of M and N .

Does your result change if extra multiplications outside of FFTs are *not* allowed?

Penn ESE 531 Spring 2017 - Khanna

61

Big Ideas

- Discrete Fourier Transform (DFT)
 - For finite signals assumed to be zero outside of defined length
 - N-point DFT is sampled DTFT at N points
 - Useful properties allow easier linear convolution
- Fast Convolution Methods
 - Use circular convolution (i.e DFT) to perform fast linear convolution
 - Overlap-Add, Overlap-Save
 - Circular convolution is linear convolution with aliasing
- Fast Fourier Transform
 - Enable computation of an N-point DFT (or DFT⁻¹) with the order of just $N \cdot \log_2 N$ complex multiplications.
- Design DSP systems to minimize computations!
