

## ESE 531: Digital Signal Processing

Lec 23: April 17, 2018  
Spectral Analysis

Penn ESE 531 Spring 2018 – Khanna  
Adapted from M. Lustig, EECS Berkeley

### Lecture Outline

- ❑ Frequency analysis with DFT
- ❑ Windowing
- ❑ Effect of zero-padding
- ❑ Time-dependent Fourier transform
  - Aka short-time Fourier transform

Penn ESE 531 Spring 2018 – Khanna  
Adapted from M. Lustig, EECS Berkeley

2

## Spectral Analysis Using the DFT

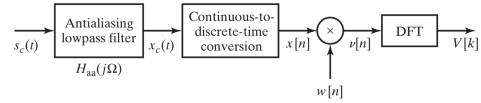

- ❑ DFT is a tool for spectrum analysis
- ❑ Should be simple:
  - Take a block, compute spectrum with DFT
- ❑ But, there are issues and tradeoffs:
  - Signal duration vs spectral resolution
  - Sampling rate vs spectral range
  - Spectral sampling rate
  - Spectral artifacts

Penn ESE 531 Spring 2018 – Khanna  
Adapted from M. Lustig, EECS Berkeley

3

## Spectral Analysis Using the DFT

- ❑ Steps for processing continuous time (CT) signals

Penn ESE 531 Spring 2018 – Khanna  
Adapted from M. Lustig, EECS Berkeley

4

## Spectral Analysis Using the DFT

- ❑ Two important tools:
  - Applying a window → reduced artifacts
  - Zero-padding → increases spectral sampling

Parameter	Symbol	Units
Sampling interval	$T$	s
Sampling frequency	$\Omega_s = \frac{2\pi}{T}$	rad/s
Window length	$L$	unitless
Window duration	$L \cdot T$	s
DFT length	$N \geq L$	unitless
DFT duration	$N \cdot T$	s
Spectral resolution	$\frac{\Omega_s}{N} = \frac{2\pi}{N \cdot T}$	rad/s
Spectral sampling interval	$\frac{\Omega_s}{N} = \frac{2\pi}{N \cdot T}$	rad/s

Penn ESE 531 Spring 2018 – Khanna  
Adapted from M. Lustig, EECS Berkeley

5

## CT Signal Example

$$x_c(t) = A_1 \cos(\omega_1 t) + A_2 \cos(\omega_2 t)$$
$$X_c(j\Omega) = A_1 [\delta(\Omega - \omega_1) + \delta(\Omega + \omega_1)] + A_2 [\delta(\Omega - \omega_2) + \delta(\Omega + \omega_2)]$$

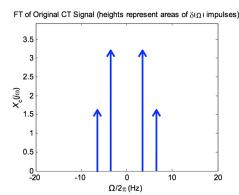

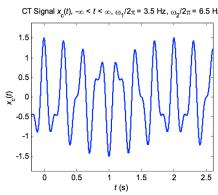

Penn ESE 531 Spring 2018 – Khanna  
Adapted from M. Lustig, EECS Berkeley

6

## CT Signal Example

$$x_c(t) = A_1 \cos(\omega_1 t) + A_2 \cos(\omega_2 t)$$

$$X_c(j\Omega) = A_1 [\delta(\Omega - \omega_1) + \delta(\Omega + \omega_1)] + A_2 [\delta(\Omega - \omega_2) + \delta(\Omega + \omega_2)]$$

Penn ESE 531 Spring 2018 – Khanna  
Adapted from M. Lustig, EECS Berkeley

7

## Sampled CT Signal Example

- If we sample the signal over an infinite time duration, we would have:

$$x[n] = x_c(t) \Big|_{t=nT}, \quad -\infty < n < \infty$$

- With the discrete time Fourier transform (DTFT):

$$X(e^{j\Omega T}) = \frac{1}{T} \sum_{r=-\infty}^{\infty} X_c\left(j\left(\Omega - r \frac{2\pi}{T}\right)\right), \quad -\infty < \Omega < \infty$$

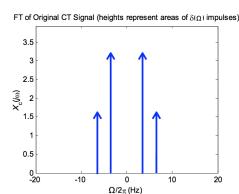

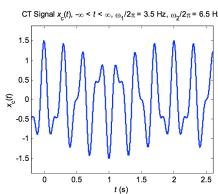

Penn ESE 531 Spring 2018 – Khanna  
Adapted from M. Lustig, EECS Berkeley

8

## CT Signal Example

$$x_c(t) = A_1 \cos(\omega_1 t) + A_2 \cos(\omega_2 t)$$

$$X_c(j\Omega) = A_1 [\delta(\Omega - \omega_1) + \delta(\Omega + \omega_1)] + A_2 [\delta(\Omega - \omega_2) + \delta(\Omega + \omega_2)]$$

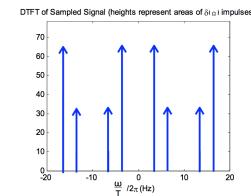

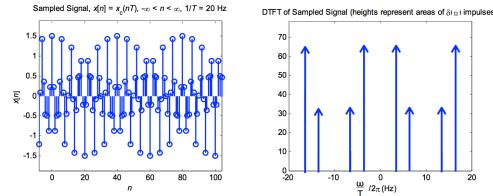

Penn ESE 531 Spring 2018 – Khanna  
Adapted from M. Lustig, EECS Berkeley

9

## Sampled CT Signal Example

- Sampling with  $\Omega s/2\pi = 1/T = 20 \text{ Hz}$

Penn ESE 531 Spring 2018 - Khanna

10

## Windowed Sampled CT Signal

- In any real system, we sample only over a finite block of L samples:

$$x[n] = x_c(t) \Big|_{t=nT}, \quad 0 < n < L-1$$

- This simply corresponds to a rectangular window of duration L
- Recall there are many other window types
  - Hann, Hamming, Blackman, Kaiser, etc.

Penn ESE 531 Spring 2018 - Khanna

11

## Windowed Sampled CT Signal

- We take the block of signal samples and multiply by a window of duration L, obtaining:

$$v[n] = x[n] \cdot w[n], \quad 0 < n < L-1$$

- If the window  $w[n]$  has DTFT,  $W(e^{j\omega})$ , then the windowed block of signal samples has a DTFT given by the periodic convolution between  $X(e^{j\omega})$  and  $W(e^{j\omega})$ :

$$V(e^{j\omega}) = \frac{1}{2\pi} \int_{-\pi}^{\pi} X(e^{j\theta}) W(e^{j(\omega-\theta)}) d\theta$$

Penn ESE 531 Spring 2018 - Khanna

12

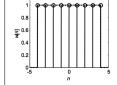

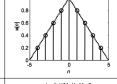

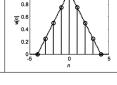

## Windowed Sampled CT Signal

- Convolution with  $W(e^{j\omega})$  has two effects in the spectrum:
  - It limits the spectral resolution
    - Main lobes of the DTFT of the window
  - The window can produce spectral leakage
    - Side lobes of the DTFT of the window
- These two are always a tradeoff
  - time-frequency uncertainty principle

Penn ESE 531 Spring 2018 - Khanna

13

## Windows

Name(s)	Definition	MATLAB Command	Graph ( $M=8$ )
Rectangular Boxcar Fourier	$w[n] = \begin{cases} 1 &  n  \leq M/2 \\ 0 &  n  > M/2 \end{cases}$	boxcar(M+1)	
Triangular	$w[n] = \begin{cases} 1 - \frac{ n }{M/2 + 1} &  n  \leq M/2 \\ 0 &  n  > M/2 \end{cases}$	triang(M+1)	
Bartlett	$w[n] = \begin{cases} 1 - \frac{ n }{M/2} &  n  \leq M/2 \\ 0 &  n  > M/2 \end{cases}$	bartlett(M+1)	

Penn ESE 531 Spring 2018 - Khanna

14

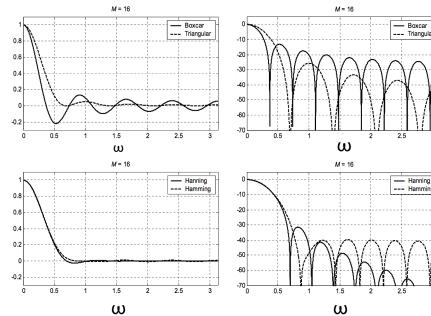

## Windows

Name(s)	Definition	MATLAB Command	Graph ( $M=8$ )
Hann	$w[n] = \begin{cases} \frac{1}{2} \left[ 1 + \cos\left(\frac{\pi n}{M/2}\right) \right] &  n  \leq M/2 \\ 0 &  n  > M/2 \end{cases}$	hann(M+1)	
Hanning	$w[n] = \begin{cases} \frac{1}{2} \left[ 1 + \cos\left(\frac{\pi n}{M/2 + 1}\right) \right] &  n  \leq M/2 \\ 0 &  n  > M/2 \end{cases}$	hanning(M+1)	
Hamming	$w[n] = \begin{cases} 0.54 + 0.46 \cos\left(\frac{\pi n}{M/2}\right) &  n  \leq M/2 \\ 0 &  n  > M/2 \end{cases}$	hamming(M+1)	

Penn ESE 531 Spring 2018 - Khanna

15

## Windows

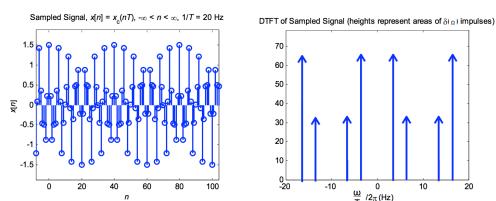

Penn ESE 531 Spring 2018 - Khanna

16

## Sampled CT Signal Example

- Sampling with  $\Omega_s/2\pi = 1/T = 20\text{Hz}$

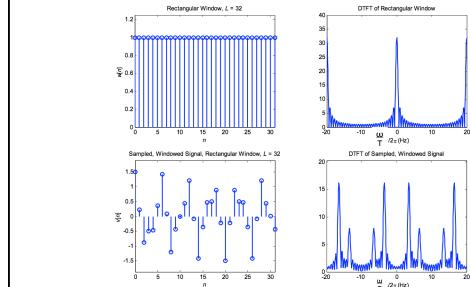

Penn ESE 531 Spring 2018 - Khanna

17

## Windowed Sampled CT Signal Example

- As before, the sampling rate is  $\Omega_s/2\pi = 1/T = 20\text{Hz}$
- Rectangular Window,  $L = 32$

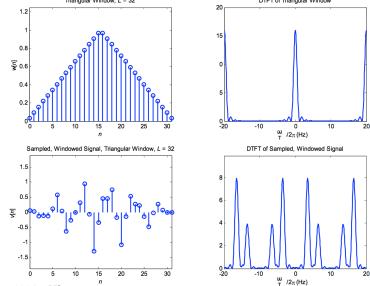

Penn ESE 531 Spring 2018 - Khanna

18

## Windowed Sampled CT Signal Example

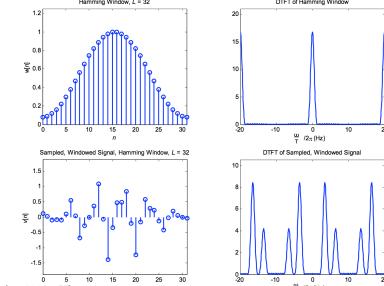

- As before, the sampling rate is  $\Omega_s/2\pi = 1/T = 20\text{Hz}$
- Triangular Window,  $L = 32$

Penn ESE 531 Spring 2018 - Khanna 19

## Windowed Sampled CT Signal Example

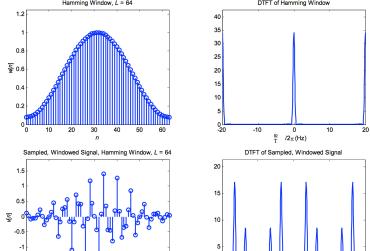

- As before, the sampling rate is  $\Omega_s/2\pi = 1/T = 20\text{Hz}$
- Hamming Window,  $L = 32$

Penn ESE 531 Spring 2018 - Khanna 20

## Windowed Sampled CT Signal Example

- As before, the sampling rate is  $\Omega_s/2\pi = 1/T = 20\text{Hz}$
- Hamming Window,  $L = 64$

Penn ESE 531 Spring 2018 - Khanna 21

## Optimal Window: Kaiser

- Minimum main-lobe width for a given sidelobe energy percentage

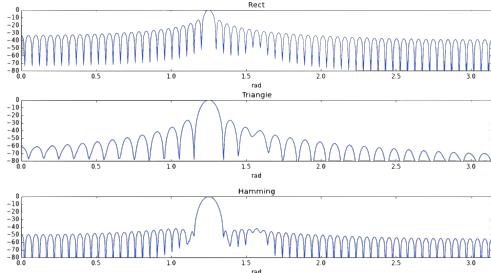

$$\frac{\int_{\text{sidelobes}} |H(e^{j\omega})|^2 d\omega}{\int_{-\pi}^{\pi} |H(e^{j\omega})|^2 d\omega}$$

- Window is parameterized with  $L$  and  $\beta$ 
  - $\beta$  determines side-lobe level
  - $L$  determines main-lobe width

Penn ESE 531 Spring 2018 - Khanna 22

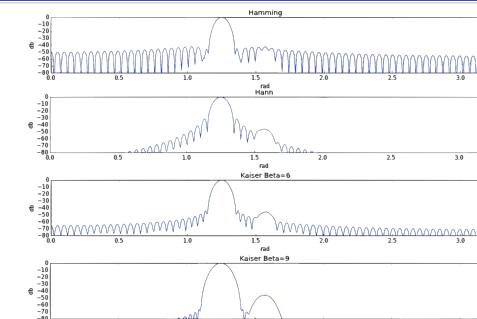

## Window Comparison Example

$$y[n] = \sin(2\pi 0.1992n) + 0.005 \sin(2\pi 0.25n) \quad |0 \leq n \leq 128$$

Penn ESE 531 Spring 2018 - Khanna 23

## Window Comparison Example

Penn ESE 531 Spring 2018 - Khanna 24

## Zero-Padding

- In preparation for taking an N-point DFT, we may zero-pad the windowed block of signal samples

$$\begin{cases} v[n] & 0 \leq n \leq L-1 \\ 0 & L \leq n \leq N-1 \end{cases}$$

- This zero-padding has no effect on the DTFT of  $v[n]$ , since the DTFT is computed by summing over infinity
- Effect of Zero Padding**
  - We take the N-point DFT of the zero-padded  $v[n]$ , to obtain the block of N spectral samples:

Penn ESE 531 Spring 2018 - Khanna

25

## Zero-Padding

- Consider the DTFT of the zero-padded  $v[n]$ . Since the zero-padded  $v[n]$  is of length N, its DTFT can be written:

$$V(e^{j\omega}) = \sum_{n=0}^{N-1} v[n]e^{-jn\omega}, \quad -\infty < \omega < \infty$$

- The N-point DFT of  $v[n]$  is given by:

$$V[k] = \sum_{n=0}^{N-1} v[n]W_N^{kn} = \sum_{n=0}^{N-1} v[n]e^{-j(2\pi/N)nk}, \quad 0 \leq k \leq N-1$$

- We know that the DFT is a sample  $V(e^{j\omega})$ :

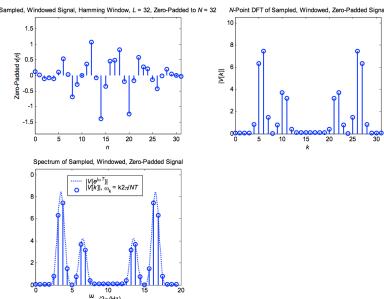

$$V[k] = V(e^{j\omega}) \Big|_{\omega=k\frac{2\pi}{N}}, \quad 0 \leq k \leq N-1$$

Penn ESE 531 Spring 2018 - Khanna

26

## Frequency Analysis with DFT

- Hamming window,  $L = N = 32$

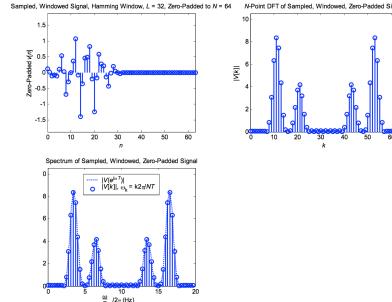

Penn ESE 531 Spring 2018 - Khanna

27

## Frequency Analysis with DFT

- Hamming window,  $L = 32$ , Zero-padded to  $N = 64$

Penn ESE 531 Spring 2018 - Khanna

28

## Frequency Analysis with DFT

- Length of window determines spectral resolution
- Type of window determines side-lobe amplitude
  - Some windows have better tradeoff between resolution-side lobe
- Zero-padding approximates the DTFT better. Does not introduce new information!

Penn ESE 531 Spring 2018 - Khanna

29

## Potential Problems and Solutions

- 1. Spectral error
  - a. Filter signal to reduce frequency content above  $\Omega_s/2 = \pi/T$ .
  - b. Increase sampling frequency  $\Omega_s = 2\pi/T$ .
- 2. Insufficient frequency resolution
  - a. Increase L.
  - b. Use window having narrow main lobe.
- 3. Spectral error from leakage
  - a. Use window having low side lobes.
  - b. Increase L.
- 4. Missing features due to spectral sampling
  - a. Increase L.
  - b. Increase N by zero-padding  $v[n]$  to length  $N > L$ .

Penn ESE 531 Spring 2018 - Khanna

30

## Time Dependent DFT

Penn ESE 531 Spring 2018 - Khanna

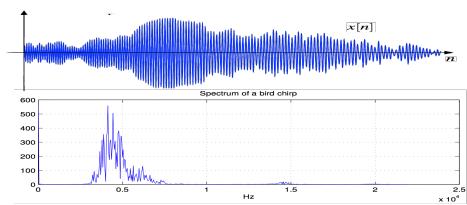

## DFT

- ❑ DFT is only one out of a LARGE class of transforms
- ❑ Used for:
  - Analysis
  - Compression
  - Denoising
  - Detection
  - Recognition
  - Approximation (Sparse)

32

## Example of Spectral Analysis

- ❑ Spectrum of a bird chirping
  - Interesting,... but...
  - Does not tell the whole story
  - No temporal information!

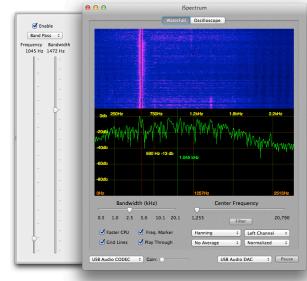

Penn ESE 531 Spring 2018 - Khanna

33

## iSpectrum Demo

- ❑ <https://dogparksoftware.com/iSpectrum.html>

Penn ESE 531 Spring 2018 - Khanna

34

## Time Dependent Fourier Transform

- ❑ Also called short-time Fourier transform
- ❑ To get temporal information, use part of the signal around every time point

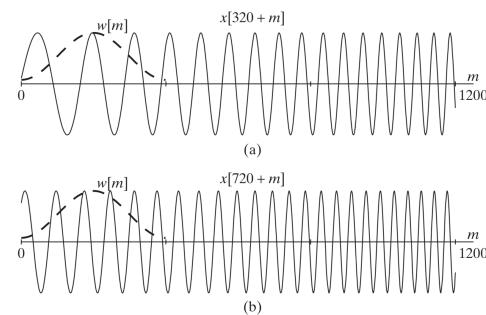

$$X[n, \lambda] = \sum_{m=-\infty}^{\infty} x[n+m]w[m]e^{-j\lambda m}$$

- ❑ Mapping from 1D  $\rightarrow$  2D, n discrete,  $\lambda$  cont.
- ❑ Simply slide a window and compute DTFT

Penn ESE 531 Spring 2018 - Khanna

35

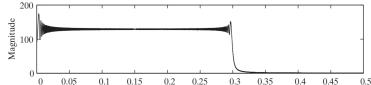

## Time Dependent Fourier Transform

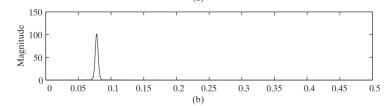

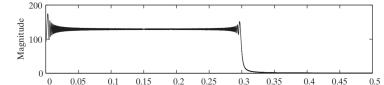

Penn ESE 531 Spring 2018 - Khanna

36

## Time Dependent Fourier Transform

39

## Spectrogram

### Plotting $Y[n, \lambda]$

$$y[n] = \begin{cases} 0 & n < 0 \\ \cos(\alpha_0 n^2) & 0 \leq n \leq 20,000 \\ \cos(0.2\pi n) & 20,000 < n \leq 25,000 \\ \cos(0.2\pi n) + \cos(0.23\pi n) & 25,000 < n. \end{cases}$$

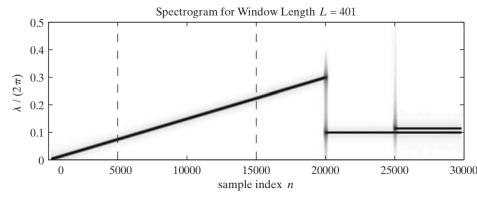

Penn ESE 531 Spring 2018 - Khanna

40

## Spectrogram

### Plotting $Y[n, \lambda]$

$$y[n] = \begin{cases} 0 & n < 0 \\ \cos(\alpha_0 n^2) & 0 \leq n \leq 20,000 \\ \cos(0.2\pi n) & 20,000 < n \leq 25,000 \\ \cos(0.2\pi n) + \cos(0.23\pi n) & 25,000 < n. \end{cases}$$

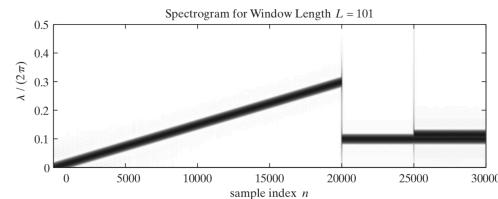

Penn ESE 531 Spring 2018 - Khanna

41

## Spectrogram

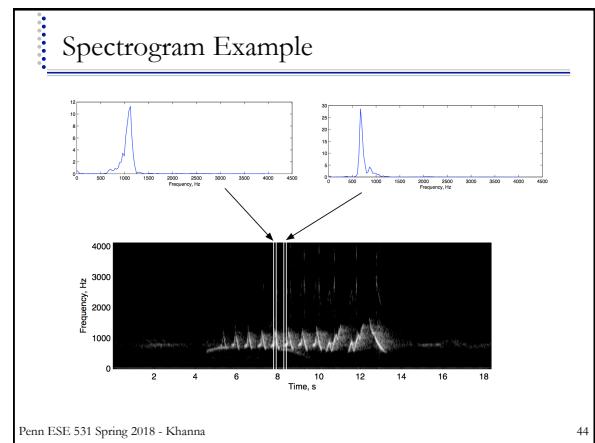

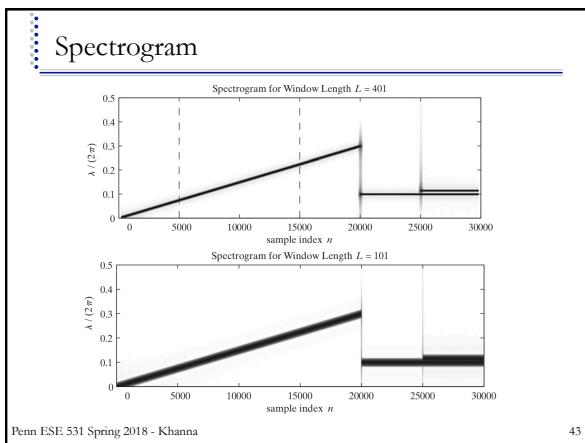

### Plotting $Y[n, \lambda]$

$$y[n] = \begin{cases} 0 & n < 0 \\ \cos(\alpha_0 n^2) & 0 \leq n \leq 20,000 \\ \cos(0.2\pi n) & 20,000 < n \leq 25,000 \\ \cos(0.2\pi n) + \cos(0.23\pi n) & 25,000 < n. \end{cases}$$

Penn ESE 531 Spring 2018 - Khanna

42

### Discrete Time-Dependent Fourier Transform

$$X[n, \lambda] = \sum_{m=-\infty}^{\infty} x[n+m]w[m]e^{-j\lambda m}$$

$$X[rR, k] = X[rR, 2\pi k / N] = \sum_{m=0}^{L-1} x[rR+m]w[m]e^{-j(2\pi/N)km}$$

- ◻ L - Window length
- ◻ R - Jump of samples
- ◻ N - DFT length

Penn ESE 531 Spring 2018 - Khanna 45

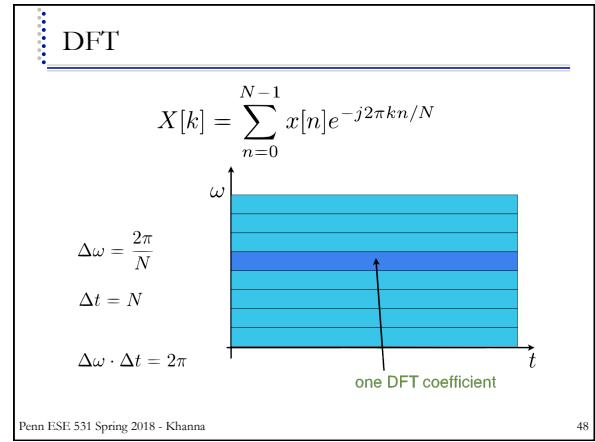

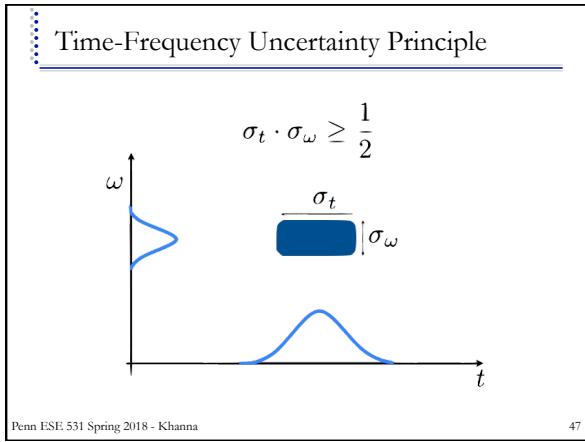

### Discrete Time-Dependent Fourier Transform

$$X[n, \lambda] = \sum_{m=-\infty}^{\infty} x[n+m]w[m]e^{-j\lambda m}$$

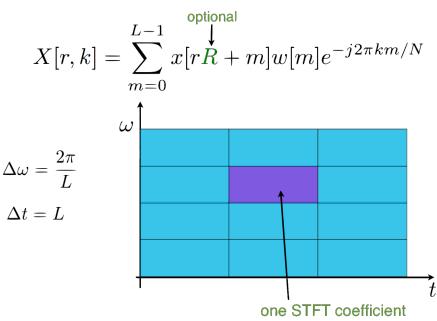

$$X[rR, k] = X[rR, 2\pi k / N] = \sum_{m=0}^{L-1} x[rR+m]w[m]e^{-j(2\pi/N)km}$$

$$X_r[k] = \sum_{m=0}^{L-1} x[rR+m]w[m]e^{-j(2\pi/N)km}$$

Penn ESE 531 Spring 2018 - Khanna 46

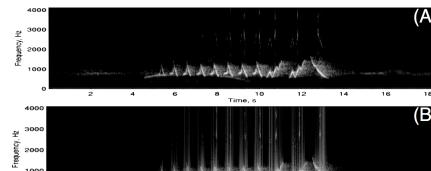

## Discrete STFT

Penn ESE 531 Spring 2018 - Khanna

49

## Spectrogram

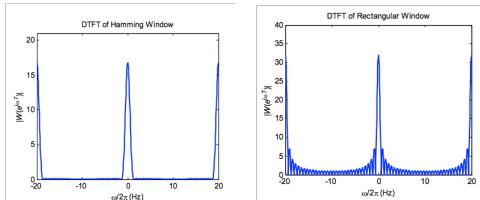

- What is the difference between the spectrograms?

- Window size B < A
- Window size B > A
- Window type is different
- (A) uses overlapping window

Penn ESE 531 Spring 2018 - Khanna

50

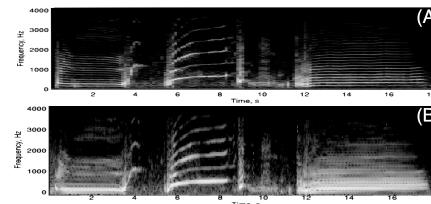

## Sidelobes of Windows

Penn ESE 531 Spring 2018 - Khanna

51

## Spectrogram

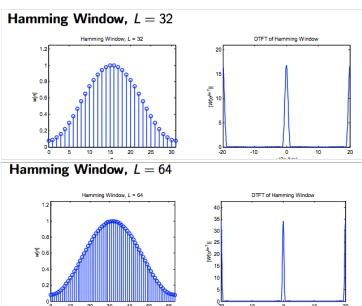

- What is the difference between the spectrograms?

- Window size B < A
- Window size B > A
- Window type is different
- (A) uses overlapping window

Penn ESE 531 Spring 2018 - Khanna

52

## Window Size

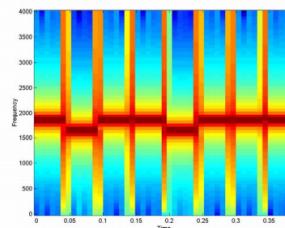

Penn ESE 531 Spring 2018 - Khanna

53

## Application - Frequency Shift Keying

- FSK Communications
  - Spectrogram transmitting 'H' (ASCII H = 01001000)

Penn ESE 531 Spring 2018 - Khanna

54

## STFT Reconstruction

- ◻ If  $R \leq L \leq N$ , then we can recover  $x[n]$  block-by-block from  $X_r[k]$
- ◻ For non-overlapping windows,  $R=L$

$$x_r[m] = \frac{1}{N} \sum_{k=0}^{N-1} X_r[k] e^{j2\pi km/N}$$

Penn ESE 531 Spring 2018 - Khanna

55

## STFT Reconstruction

- ◻ If  $R \leq L \leq N$ , then we can recover  $x[n]$  block-by-block from  $X_r[k]$
- ◻ For non-overlapping windows,  $R=L$

$$x_r[m] = \frac{1}{N} \sum_{k=0}^{N-1} X_r[k] e^{j2\pi km/N}$$

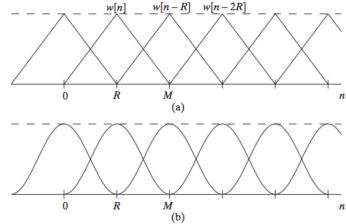

$$x[n] = \frac{x_r[n-rR]}{w[n-rR]} \quad \forall rR \leq n \leq (r+1)R-1$$

Penn ESE 531 Spring 2018 - Khanna

56

## SSTF Reconstruction with overlap

- ◻ Practically make  $R < L < N$
- ◻ If we choose  $R$ ,  $L$ , and  $N$  appropriately with window, the overlap-add will negate the window effect

Penn ESE 531 Spring 2018 - Khanna

57

## Big Ideas

- ◻ Frequency analysis with DFT
  - Nontrivial to choose sampling frequency, signal length, window type, DFT length (zero-padding)
  - Get accurate representation of DFT
- ◻ Time-dependent Fourier transform
  - Aka short-time Fourier transform
  - Includes temporal information about signal
  - Useful for many applications
    - Analysis, Compression, Denoising, Detection, Recognition, Approximation (Sparse)
  - Overlap for reconstruction
