3

Interchanging Operations - Summary

*Expanded filter = expanded impulse response, compressed freq response

Penn ESE 531 Spring 2019 - Khanna

4

Polyphase Decomposition

- The polyphase decomposition of a sequence is obtained by representing it as a superposition of M subsequences, each consisting of every Mth value of successively delayed versions of the sequence.
- When this decomposition is applied to a filter impulse response, it can lead to efficient implementation structures for linear filters in several contexts.

Penn ESE 531 Spring 2019 - Khanna

5

Polyphase Decomposition

- We can decompose an impulse response (of our filter) to:

$$h[n] = \sum_{k=0}^{M-1} h_k[n-k]$$

Penn ESE 531 Spring 2019 - Khanna

6

Polyphase Decomposition

- We can decompose an impulse response (of our filter) to:

$$h[n] = \sum_{k=0}^{M-1} h_k[n-k]$$

M=2

Penn ESE 531 Spring 2019 - Khanna

7

Polyphase Decomposition

- We can decompose an impulse response (of our filter) to:

$$h[n] = \sum_{k=0}^{M-1} h_k[n-k]$$

M=2

Penn ESE 531 Spring 2019 - Khanna

8

Polyphase Decomposition

$$h_k[n] \rightarrow \downarrow M \rightarrow e_k[n]$$

$$e_k[n] = h_k[nM]$$

M=2

Penn ESE 531 Spring 2019 - Khanna

9

Polyphase Decomposition

$$h_k[n] \rightarrow \downarrow M \rightarrow e_k[n]$$

$$e_k[n] = h_k[nM]$$

M=2

Penn ESE 531 Spring 2019 - Khanna

10

Polyphase Decomposition

$$e_k[n] \rightarrow \uparrow M \rightarrow h_k[n]$$

recall upsampling $\Rightarrow$ scaling

$$H_k(z) = E_k(z^M)$$

Penn ESE 531 Spring 2019 - Khanna

11

Polyphase Decomposition

$$e_k[n] \rightarrow \uparrow M \rightarrow h_k[n]$$

recall upsampling $\Rightarrow$ scaling

$$H_k(z) = E_k(z^M)$$

Also, recall:

$$h[n] = \sum_{k=0}^{M-1} h_k[n-k]$$

So,

$$H(z) = \sum_{k=0}^{M-1} E_k(z^M) z^{-k}$$

Penn ESE 531 Spring 2019 - Khanna

12

Polyphase Decomposition

$$H(z) = \sum_{k=0}^{M-1} E_k(z^M) z^{-k}$$

Penn ESE 531 Spring 2019 - Khanna

13

Polyphase Implementation of Decimation

$$x[n] \rightarrow H(z) \rightarrow y[n] \rightarrow \downarrow M \rightarrow w[n] = y[nM]$$

□ Problem:

- Compute all $y[n]$ and then throw away -- wasted computation!

Penn ESE 531 Spring 2019 - Khanna

14

Polyphase Implementation of Decimation

$$x[n] \rightarrow H(z) \rightarrow y[n] \rightarrow \downarrow M \rightarrow w[n] = y[nM]$$

□ Problem:

- Compute all $y[n]$ and then throw away -- wasted computation!
- For FIR length $N \rightarrow N$ multiplications/unit time

26

Multi-Rate Filter Banks

- Use filter banks to operate on a signal differently in different frequency bands
- To save computation, reduce the rate after filtering
- $h_0[n]$ is low-pass, $h_1[n]$ is high-pass
- Often $h_1[n] = e^{j\pi n} h_0[n]$ ← shift freq resp by π

Penn ESE 531 Spring 2019 - Khanna

27

Multi-Rate Filter Banks

- Assume h_0, h_1 are ideal low/high pass with $\omega_c = \pi/2$
