## ESE 531: Digital Signal Processing

Lec 18: March 28, 2019 Optimal Filter Design

- Window method
  - Design Filters heuristically using windowed sinc functions
  - Choose order and window type
  - Check DTFT to see if filter specs are met
- Optimal design
  - Design a filter h[n] with  $H(e^{j\omega})$
  - Approximate  $H_d(e^{j\omega})$  with some optimality criteria or satisfies specs.

Mathematical Optimization

#### (mathematical) optimization problem

minimize  $f_0(x)$ subject to  $f_i(x) \le b_i, \quad i = 1, \dots, m$ 

- $x = (x_1, \ldots, x_n)$ : optimization variables
- $f_0: \mathbf{R}^n \to \mathbf{R}$ : objective function
- $f_i: \mathbf{R}^n \to \mathbf{R}, i = 1, \dots, m$ : constraint functions

## **optimal solution** $x^{\star}$ has smallest value of $f_0$ among all vectors that satisfy the constraints

#### portfolio optimization

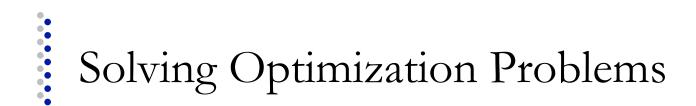

- variables: amounts invested in different assets
- constraints: budget, max./min. investment per asset, minimum return
- objective: overall risk or return variance

#### device sizing in electronic circuits

- variables: device widths and lengths
- constraints: manufacturing limits, timing requirements, maximum area
- objective: power consumption

#### data fitting

- variables: model parameters
- constraints: prior information, parameter limits
- objective: measure of misfit or prediction error

#### general optimization problem

- very difficult to solve
- methods involve some compromise, e.g., very long computation time, or not always finding the solution

exceptions: certain problem classes can be solved efficiently and reliably

- least-squares problems
- linear programming problems
- convex optimization problems

Least-Squares Optimization

minimize  $||Ax - b||_2^2$ 

#### solving least-squares problems

- analytical solution:  $x^{\star} = (A^T A)^{-1} A^T b$
- reliable and efficient algorithms and software
- computation time proportional to  $n^2k$  ( $A \in \mathbf{R}^{k \times n}$ ); less if structured
- a mature technology

#### using least-squares

- least-squares problems are easy to recognize
- a few standard techniques increase flexibility (*e.g.*, including weights, adding regularization terms)

$$\begin{array}{ll} \mbox{minimize} & c^T x \\ \mbox{subject to} & a_i^T x \leq b_i, \quad i=1,\ldots,m \end{array}$$

#### solving linear programs

- no analytical formula for solution
- reliable and efficient algorithms and software
- computation time proportional to  $n^2m$  if  $m \ge n$ ; less with structure
- a mature technology

#### using linear programming

- not as easy to recognize as least-squares problems
- a few standard tricks used to convert problems into linear programs (e.g., problems involving ℓ<sub>1</sub>- or ℓ<sub>∞</sub>-norms, piecewise-linear functions)

$$\begin{array}{ll} \mbox{minimize} & f_0(x) \\ \mbox{subject to} & f_i(x) \leq b_i, \quad i=1,\ldots,m \end{array}$$

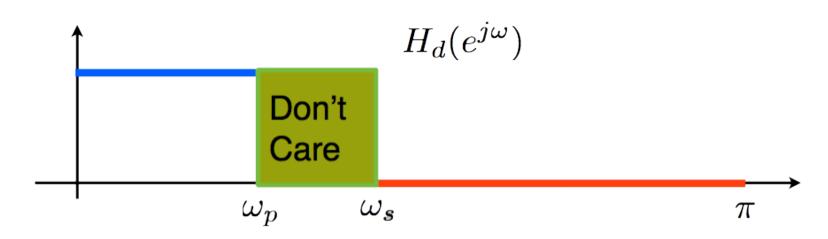

• objective and constraint functions are convex:

$$f_i(\alpha x + \beta y) \le \alpha f_i(x) + \beta f_i(y)$$

 $\text{ if } \alpha+\beta=1 \text{, } \alpha\geq 0 \text{, } \beta\geq 0 \\$ 

• includes least-squares problems and linear programs as special cases

□ Least Squares:

minimize 
$$\int_{\omega \in \text{care}} |H(e^{j\omega}) - H_d(e^{j\omega})|^2 d\omega$$

□ Variation: Weighted Least Squares:

minimize 
$$\int_{-\pi}^{\pi} W(\omega) |H(e^{j\omega}) - H_d(e^{j\omega})|^2 d\omega$$

Design Through Optimization

□ Idea: Sample/discretize the frequency response

$$H(e^{j\omega}) \Rightarrow H(e^{j\omega_k})$$

• Sample points are fixed  $\omega_k = k \frac{\pi}{P}$ 

$$-\pi \leq \omega_1 < \cdots < \omega_p \leq \pi$$

- □ M+1 is the filter order
- $\square$  P >> M + 1 (rule of thumb P=15M)
- Yields a (good) approximation of the original problem

- Target: Design M+1=2N+1 filter
- First design non-causal  $\tilde{H}(e^{j\omega})$  and hence  $\tilde{h}[n]$

- Target: Design M+1=2N+1 filter
- First design non-causal  $\tilde{H}(e^{j\omega})$  and hence  $\tilde{h}[n]$
- □ Then, shift to make causal

$$\begin{split} h[n] &= \tilde{h}[n-M/2] \\ H(e^{j\omega}) &= e^{-j\frac{M}{2}}\tilde{H}(e^{j\omega}) \end{split}$$

$$\tilde{h} = \left[\tilde{h}[-N], \tilde{h}[-N+1], \cdots, \tilde{h}[N]\right]^T$$

$$b = \left[H_d(e^{j\omega_1}), \cdots, H_d(e^{j\omega_P})\right]^T$$

$$A = \begin{bmatrix} e^{-j\omega_{1}(-N)} & \cdots & e^{-j\omega_{1}(+N)} \\ \vdots \\ e^{-j\omega_{P}(-N)} & \cdots & e^{-j\omega_{P}(+N)} \end{bmatrix}$$
$$\operatorname{argmin}_{\tilde{h}} ||A\tilde{h} - b||^{2}$$

Solution:

$$\operatorname{argmin}_{\tilde{h}} ||A\tilde{h} - b||^2$$

$$\tilde{h} = (A^*A)^{-1}A^*b$$

- Result will generally be non-symmetric and complex valued.
- However, if  $\tilde{H}(e^{j\omega})$  is real,  $\tilde{h}[n]$  should have symmetry!

Design of Linear-Phase L.P Filter

## □ Suppose:

- $\tilde{H}(e^{j\omega})$  is real-symmetric
- M is even (M+1 length)

**•** Then:

•  $\tilde{h}[n]$  is real-symmetric around midpoint

• So:

$$\begin{split} \tilde{H}(e^{j\omega}) &= \tilde{h}[0] + \tilde{h}[1]e^{-j\omega} + \tilde{h}[-1]e^{+j\omega} \\ &+ \tilde{h}[2]e^{-j2\omega} + \tilde{h}[-2]e^{+j2\omega} \cdots \\ &= \tilde{h}[0] + 2\cos(\omega)\tilde{h}[1] + 2\cos(2\omega)\tilde{h}[2] + \cdots \end{split}$$

Reminder: FIR GLP: Type I – Example, M=4

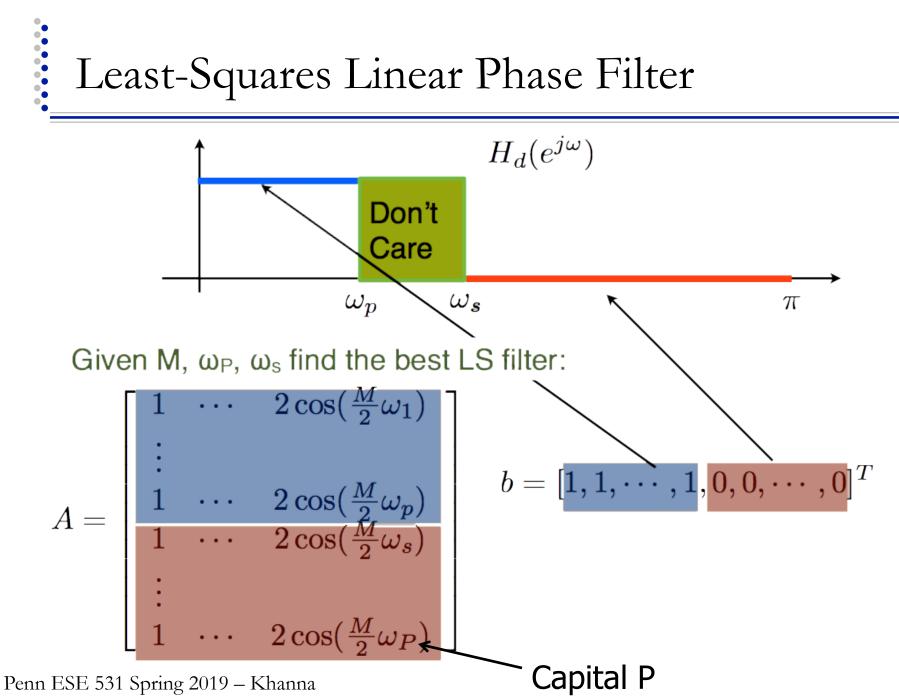

Type I Even Symmetry, M even

$$h[n] = h[M - n], \quad n = 0, 1, ..., M$$

Then 
$$H(e^{j\omega}) = \sum_{n=0}^{M} h[n]e^{-j\omega n} = \underbrace{A(w)}_{\text{Real, Even}} e^{-j\omega M/2}$$
 integer delay

$$H(e^{j\omega}) = h[0] + h[1]e^{-j\omega} + h[2]e^{-j2\omega} + h[3]e^{-j3\omega} + h[4]e^{-j4\omega}$$
  
=  $e^{-j2\omega} \Big[ h[0]e^{j2\omega} + h[1]e^{j\omega} + h[2] + h[1]e^{-j\omega} + h[0]e^{-j2\omega} \Big]$   
=  $\Big[ 2h[0]\cos(2\omega) + 2h[1]\cos(\omega) + h[2] \Big] e^{-j2\omega}$   
 $A(\omega) (even)$ 

Penn ESE 531 Spring 2019 – Khanna Adapted from M. Lustig, EECS Berkeley

Adapted from M. Lustig, EECS Berkeley

Given M,  $\omega_P$ ,  $\omega_s$  find the best LS filter:

$$A = \begin{bmatrix} 1 & \cdots & 2\cos(\frac{M}{2}\omega_{1}) \\ \vdots & & \\ 1 & \cdots & 2\cos(\frac{M}{2}\omega_{p}) \\ 1 & \cdots & 2\cos(\frac{M}{2}\omega_{s}) \\ \vdots & & \\ 1 & \cdots & 2\cos(\frac{M}{2}\omega_{P}) \end{bmatrix} \\ \tilde{h}_{+} = [\tilde{h}[0], \cdots, \tilde{h}[\frac{M}{2}]]^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[0], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{*}A)^{-1}A^{*}b \\ \tilde{h}_{+} = \begin{bmatrix} \tilde{h}[n], \cdots, \tilde{h}[\frac{M}{2}] \end{bmatrix}^{T} = (A^{$$

LS has no preference for pass band or stop band
Use weighting of LS to change ratio

want to solve the discrete version of:

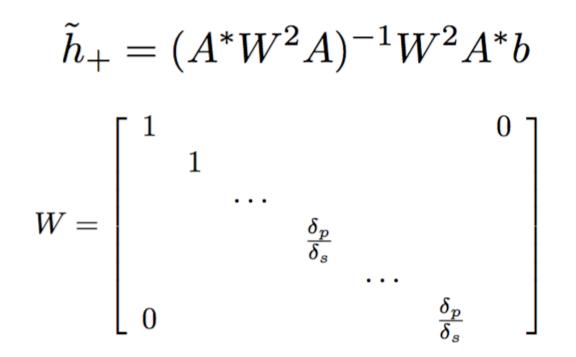

minimize 
$$\int_{-\pi}^{\pi} W(\omega) |H(e^{j\omega}) - H_d(e^{j\omega})|^2 d\omega$$

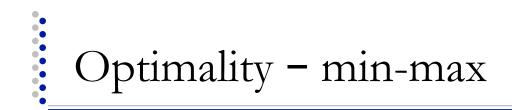

where  $W(\omega)$  is  $\delta p$  in the pass band and  $\delta s$  in stop band Similarly:  $W(\omega)$  is 1 in the pass band and  $\delta p/\delta s$  in stop band

$$\operatorname{argmin}_{\tilde{h}_{+}} \quad (A\tilde{h}_{+} - b)^* W^2 (A\tilde{h}_{+} - b)$$

Solution:

□ Chebychev Design (min-max)

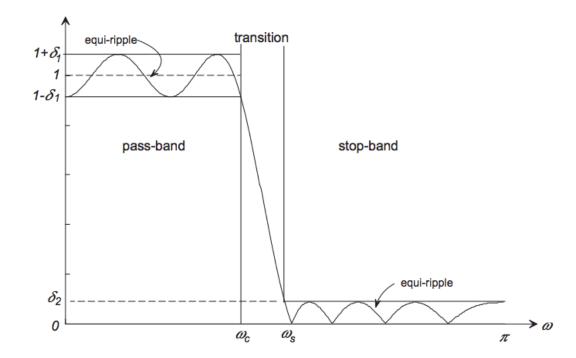

minimize<sub> $\omega \in care</sub> max |H(e^{j\omega}) - H_d(e^{j\omega})|$ </sub>

- Parks-McClellan algorithm equiripple
- Also known as Remez exchange algorithms (signal.remez)
- Can also use convex optimization

- □ Allows for multiple pass- and stop-bands.
- Is an equi-ripple design in the pass- and stop-bands, but allows independent weighting of the ripple in each band.
- □ Allows specification of the band edges.

• For the low-pass filter shown above the specifications are

$$\begin{array}{rcl} 1-\delta_1 &< & H(\mathrm{e}^{\mathrm{j}\,\omega}) &< & 1+\delta_1 & \text{ in the pass-band } 0 < \omega \leq \omega_c \\ -\delta_2 &< & H(\mathrm{e}^{\mathrm{j}\,\omega}) &< & \delta_2 & \text{ in the stop-band } \omega_s < \omega \leq \pi. \end{array}$$

Need to determine M+1 (length of the filter) and the filter coefficients {h<sub>n</sub>}

- Need to determine M+1 (length of the filter) and the filter coefficients {h<sub>n</sub>}
- If we assume M even and even symmetry FIR filter (Type I), then

$$A_e(e^{j\omega}) = h_e[0] + \sum_{n=1}^{L} 2h_e[n]\cos(\omega n).$$

$$H(e^{j\omega}) = A_e(e^{j\omega})e^{-j\omega M/2}.$$

### Reformulate

$$A_e(e^{j\omega}) = h_e[0] + \sum_{n=1}^{L} 2h_e[n]\cos(\omega n).$$

**D** To fitting a polynomial

$$A_e(e^{j\omega}) = \sum_{k=0}^L a_k(\cos\omega)^k,$$

$$A_e(e^{j\omega}) = P(x)|_{x=\cos\omega}, \qquad P(x) = \sum_{k=0}^L a_k x^k.$$

Penn ESE 531 Spring 2019 - Khanna

Define approximation error function

$$E(\omega) = W(\omega)[H_d(e^{j\omega}) - A_e(e^{j\omega})],$$

$$W(e^{j\omega}) = \begin{cases} \delta_2/\delta_1 & \text{in the pass-band} \\ 1 & \text{in the stop-band} \\ 0 & \text{in the transition band.} \end{cases}$$

Define approximation error function

$$E(\omega) = W(\omega)[H_d(e^{j\omega}) - A_e(e^{j\omega})],$$

□ Apply min-max or Chebyshev criteria

$$\min_{\{h_e[n]:0\leq n\leq L\}} \Big(\max_{\omega\in F} |E(\omega)|\Big),$$

Penn ESE 531 Spring 2019 - Khanna

### **Constraints:**

min-max pass-band ripple

$$1 - \delta_p \le |H(e^{j\omega})| \le 1 + \delta_p, \qquad 0 \le w \le \omega_p$$

min-max stop-band ripple

$$|H(e^{j\omega})| \le \delta_s, \qquad \omega_s \le w \le \pi$$

Min-Max Ripple Design • Given  $\boldsymbol{\omega}_{p}$ ,  $\boldsymbol{\omega}_{s}$ , M, find  $\boldsymbol{\delta}$ ,  $\tilde{h}_{+}$ minimize  $\delta$ Subject to :

$$1 - \delta \leq \tilde{H}(e^{j\omega_k}) \leq 1 + \delta \qquad 0 \leq \omega_k \leq \omega_p$$
$$-\delta \leq \tilde{H}(e^{j\omega_k}) \leq \delta \qquad \omega_s \leq \omega_k \leq \pi$$
$$\delta > 0$$

Formulation is a linear program with solution δ, h<sub>+</sub>
 A well studied class of problems with good solvers

 $\begin{array}{ll} \text{minimize} & \delta\\ \text{subject to}: & \\ & 1-\delta \preceq A_p \tilde{h}_+ \preceq 1+\delta\\ & -\delta \preceq A_s \tilde{h}_+ \preceq \delta\\ & \delta > 0 \end{array}$ 

$$A_{p} = \begin{bmatrix} 1 & 2\cos(\omega_{1}) & \cdots & 2\cos(\frac{M}{2}\omega_{1}) \\ \vdots & & \\ 1 & 2\cos(\omega_{p}) & \cdots & 2\cos(\frac{M}{2}\omega_{p}) \end{bmatrix}$$
$$A_{s} = \begin{bmatrix} 1 & 2\cos(\omega_{s}) & \cdots & 2\cos(\frac{M}{2}\omega_{s}) \\ \vdots & & \\ 1 & 2\cos(\omega_{P}) & \cdots & 2\cos(\frac{M}{2}\omega_{P}) \checkmark \end{bmatrix} \text{ capital P}$$

 The method is based on reformulating the problem as one in polynomial approximation, using Chebyshev polynomials

$$A_e(e^{j\omega}) = \sum_{k=0}^L a_k(\cos\omega)^k,$$

$$A_e(e^{j\omega}) = P(x)|_{x=\cos\omega}, \qquad P(x) = \sum_{k=0}^L a_k x^k.$$

Parks-McClellan - Alternation Theorem

## The algorithm uses Chebyshev's alternation theorem to recognize the optimal solution.

Define the error E(x) as above, namely

$$E(e^{j\omega}) = W(e^{j\omega}) \left( H_d(e^{j\omega}) - H(e^{j\omega}) \right)$$

and the maximum error as

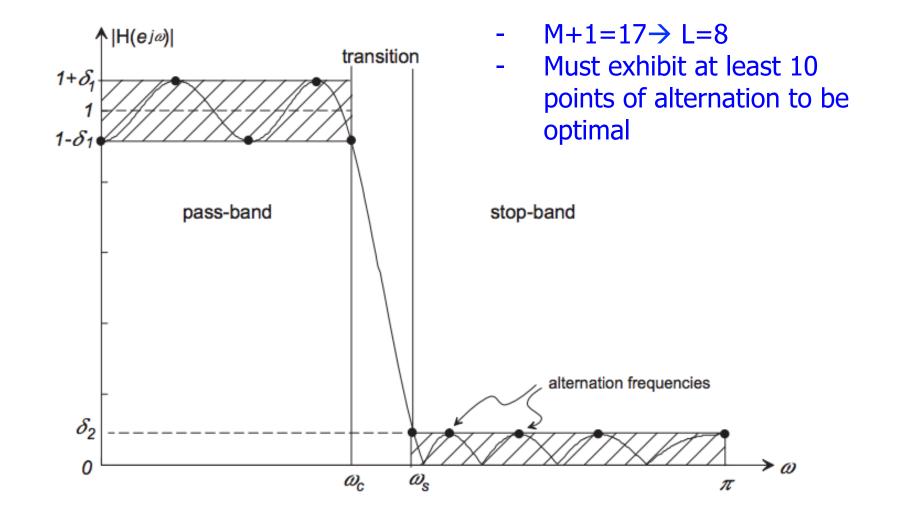

$$||E(e^{j\omega})||_{\infty} = \operatorname{argmax}_{x \in \Omega} |E(e^{j\omega})|$$

A necessary and sufficient condition that  $H(e^{j\omega})$  is the unique *L*th-order polynomial minimizing  $||E(e^{j\omega})||_{\infty}$  is that  $E(e^{j\omega})$  exhibit at least L + 2extremal frequencies, or "alternations", that is there must exist at least L+2values of  $\omega$ ,  $\omega_k \in \Omega$ ,  $k = [0, 1, \ldots, L+1]$ , such that  $\omega_0 < \omega_1 < \ldots < \omega_{L+1}$ , and such that

$$E(e^{j\omega_k}) = -E(e^{j\omega_{k+1}}) = \pm \left( \|E(e^{j\omega})\|_{\infty} \right).$$

## Example of Complex Filter

- Larson et. al, "Multiband Excitation Pulses for Hyperpolarized 13C Dynamic Chemical Shift Imaging" JMR 2008;194(1):121-127
- Need to design length 11 filter with following frequency response:

- Many tools and Solvers
- **Tools:** 
  - CVX (Matlab) <u>http://cvxr.com/cvx/</u>
  - CVXOPT, CVXMOD (Python)
- Engines:
  - Sedumi (Free)
  - MOSEK (commercial)

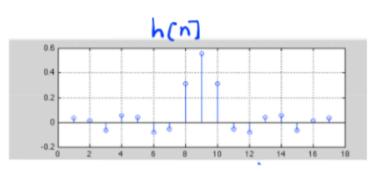

M = 16; wp = 0.5\*pi; ws = 0.6\*pi; MM = 15\*M; w = linspace(0,pi,MM);

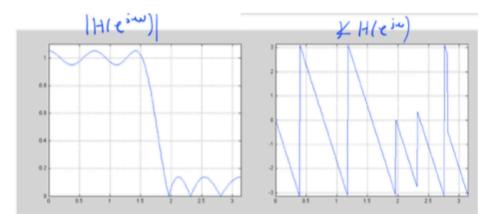

idxp = find(w <=wp); idxs = find(w >=ws);

Ap = [ones(length(idxp),1) 2\*cos(kron(w(idxp)', [1:M/2]))];As = [ones(length(idxs),1) 2\*cos(kron(w(idxs)', [1:M/2]))];

% optimization cvx\_begin variable hh(M/2+1,1); variable d(1,1);

```
minimize(d)
subject to
    Ap*hh <=1+d;
    Ap*hh >=1-d;
    As*hh < d;
    As*hh > -d;
    ds>0;
cvx_end
h = [hh(end:-1:1); hh(2:end)];
```
