Trigonometric Identity:

$$e^{j\Theta} = \cos(\Theta) + j\sin(\Theta)$$

Geometric Series:

$$\sum_{n=0}^{N} r^{n} = \frac{1-r^{N+1}}{1-r}$$
$$\sum_{n=0}^{\infty} r^{n} = \frac{1}{1-r}, |r| < 1$$

DTFT Equations:

$$X(e^{j\omega}) = \sum_{k=-\infty}^{\infty} x[k]e^{-j\omega k}$$
$$x[n] = \frac{1}{2\pi} \int_{-\pi}^{\pi} X(e^{j\omega})e^{j\omega n} d\omega$$

ESE531

Z-Transform Equations:

$$X(z) = \sum_{n=-\infty}^{\infty} x[n] z^{-n}$$
$$x[n] = \frac{1}{2\pi j} \oint_{C} X(z) z^{n-1} dz$$

Upsampling/Downsampling:

Upsampling by L (\uparrow L): $X_{up} = X(e^{j\omega L})$ Downsampling by M (\downarrow M): $X_{down} = \frac{1}{M} \sum_{i=0}^{M-1} X(e^{j(\frac{\omega}{M} - \frac{2\pi}{M}i)})$

Interchange Identities:

$$\begin{array}{rcl} x[n] & & & & & \\ & & & \\ & & & \\$$

1. (10 points) Consider a discrete-time system with input x[n] and output y[n] that satisfy the difference equation:

$$y[n] = n \cdot y[n-1] + x[n].$$
(1)

The system is causal and satisfies initial-rest conditions; i.e. if x[n] = 0 for n < 0, then y[n] = 0 for n < 0. If $x[n] = \delta[n]$, determine y[n] for all n.

2. (20 points) Suppose you have a discrete-time system with impulse response

$$h[n] = 0.9^{n} u[n] \tag{2}$$

where u[n] is the unit step function. If an input

$$x[n] = \cos\left(\frac{\pi}{6}n\right) \tag{3}$$

is applied to the system, determine the output y[n].

3. (20 points) Consider a standard system (shown below) consisting of a C/D converter, a discrete-time system, and a D/C converter. Suppose that the Fourier transform $X_c(j\Omega)$ of $x_c(t)$ obeys $X_c(j\Omega) = 0$ for $|\Omega| \ge 2\pi 1000$, and that the discrete-time system is a squarer, i.e. $y[n] = x^2[n]$.

- (a) What is the largest value of T such that $y_c(t) = x_c^2(t)$? Justify your answer.
- (b) Is the discrete-time system (the squarer) an LTI system? Justify your answer.

4. (25 points) Consider an LTI system whose response to the input signal

$$x[n] = 2\delta[n-2] + \delta[n-3] + \delta[n-4]$$
(4)

is the output signal

$$y[n] = 6\delta[n] - \delta[n-1] + 3\delta[n-2] - \delta[n-3] + \delta[n-4].$$
(5)

(a) Find the transfer function, H(z) and the impulse response, h[n], of this system.

(This page intentionally left almost blank for pagination.)

5. (25 pts) Consider the decimation filter structure shown below:

where $y_0[n]$ and $y_1[n]$ are generated according to the following difference equations:

$$y_0[n] = \frac{1}{4}y_0[n-1] - \frac{1}{3}x_0[n] + \frac{1}{8}x_0[n-1]$$
(6)

$$y_1[n] = \frac{1}{4}y_1[n-1] + \frac{1}{12}x_1[n]$$
(7)

(a) How many multiplies per output sample does the implementation of the filter structure require? (I.e How many multiplications are necessary to evaluate the current output sample assuming you have all previous inputs and outputs available.) Consider a divide to be equivalent to a multiply. The decimation filter can also be implemented as shown below:

$$\begin{array}{c} x[n] \\ \hline H(z) \\ \hline y[n] \\ \downarrow 2 \\ \hline \end{array}$$

where $v[n] = a \cdot v[n-1] + b \cdot x[n] + c \cdot x[n-1]$.

- (b) Determine a, b, and c.
- (c) How many multiplies per output sample does this second implementation require?
