$$x[n] = e^{j\omega n}$$

$$\begin{aligned} y[n] &= \sum_{k=-\infty}^{\infty} x[n-k]h[k] \\ &= \sum_{k=-\infty}^{\infty} e^{j\omega(n-k)}h[k] \\ &= e^{j\omega n} \sum_{k=-\infty}^{\infty} h[k]e^{-j\omega k} \\ &= H(e^{j\omega})e^{j\omega n} \end{aligned}$$

## Discrete Fourier Series

### Definition:

- Consider N-periodic signal:

$$\tilde{x}[n+N] = \tilde{x}[n] \quad \forall n$$

- Frequency-domain also periodic in N:

$$\tilde{X}[k+N] = \tilde{X}[k] \quad \forall k$$

- “~” indicates periodic signal/spectrum

$$x[n] \triangleq \begin{cases} \tilde{x}[n] & 0 \leq n \leq N-1 \\ 0 & \text{otherwise} \end{cases}$$

$$X[k] \triangleq \begin{cases} \tilde{X}[k] & 0 \leq k \leq N-1 \\ 0 & \text{otherwise} \end{cases}$$

### The DFT

$$x[n] = \frac{1}{N} \sum_{k=0}^{N-1} X[k] W_N^{-kn} \quad \text{Inverse DFT, synthesis}$$

$$X[k] = \sum_{n=0}^{N-1} x[n] W_N^{kn} \quad \text{DFT, analysis}$$

$$x[n] = 0 \quad \text{outside } 0 \leq n \leq N-1$$

$$X[k] = 0 \quad \text{outside } 0 \leq k \leq N-1$$

## DFT vs. DTFT

- For finite sequences of length N:

- The N-point DFT of x[n] is:

$$X[k] = \sum_{n=0}^{N-1} x[n] W_N^{kn} = \sum_{n=0}^{N-1} x[n] e^{-j(2\pi/N)nk} \quad 0 \leq k \leq N-1$$

- The DTFT of x[n] is:

$$X(e^{j\omega}) = \sum_{n=0}^{N-1} x[n] e^{-j\omega n} \quad -\infty < \omega < \infty$$

Adapted from M. Lustig, EECS Berkeley

31

## DFT vs. DTFT

- The DFT are samples of the DTFT at N equally spaced frequencies

$$X[k] = X(e^{j\omega})|_{\omega=k\frac{2\pi}{N}} \quad 0 \leq k \leq N-1$$

## Proof of Duality

$$\text{DFT of } \{x[n]\}_{n=0}^{N-1} \text{ is } X[k] = \sum_{p=0}^{N-1} x[p]e^{-j\frac{2\pi}{N}kp}; \quad k \leq 0 \leq N-1$$

$$\text{DFT of } \{X[n]\}_{n=0}^{N-1} \text{ is } \sum_{n=0}^{N-1} \sum_{p=0}^{N-1} x[p]e^{-j\frac{2\pi}{N}pn}e^{-j\frac{2\pi}{N}kn}, \quad k \leq 0 \leq N-1$$

$$= \sum_{p=0}^{N-1} x[p] \underbrace{\sum_{n=0}^{N-1} e^{-j\frac{2\pi}{N}(p+k)n}}_{N \text{ for } ((p+k))_N=0, \text{ otherwise}}$$

$$((p+k))_N = 0 \text{ for } 0 \leq p \text{ \& } k \leq N-1 \Rightarrow p = ((-k))_N$$

$$p = -k + mN = ((-k))_N + rN + mN = ((-k))_N \text{ because } 0 \leq p \leq N-1$$

$$\therefore \text{DFT of } \{X[n]\}_{n=0}^{N-1} \text{ is } N\{x[(-k)]_N\}_{k=0}^{N-1}$$

## Linear Convolution

- Next...
  - Using DFT, circular convolution is easy...
  - ...But want linear convolution not circular
- So, show how to perform linear convolution with circular convolution
- Use DFT to do linear convolution
  - Because FFT is fast implementation of DFT, do linear convolution faster via the DFT

## Big Ideas

- Discrete Fourier Transform (DFT)
  - For finite signals assumed to be zero outside of defined length
  - N-point DFT is sampled DTFT at  $N$  points
  - Useful properties allow easier linear convolution
- DFT Properties
  - Inherited from DFS, but circular operations!
