Lec 20: April 9, 2020

Fast Fourier Transform Pt 2

Lecture Outline

- DFT vs. DTFT
- FFT practice
- Chirp Transform Algorithm
- Circular convolution as linear convolution with aliasing

Discrete Fourier Transform

- The DFT

$$x[n] = \frac{1}{N}\sum_{k=0}^{N-1} X[k] W_N^{-kn} \quad \text{Inverse DFT, synthesis}$$

$$X[k] = \sum_{n=0}^{N-1} x[n] W_N^{kn} \quad \text{DFT, analysis}$$

- It is understood that,

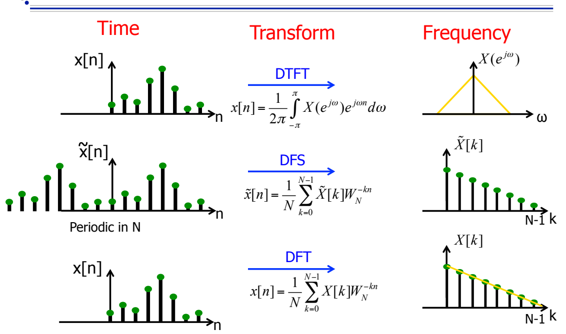
$$x[n] = 0 \quad \text{outside } 0 \le n \le N-1$$
$$X[k] = 0 \quad \text{outside } 0 \le k \le N-1$$

DFT vs. DTFT

- The DFT are samples of the DTFT at N equally spaced frequencies

$$X[k] = X(e^{j\omega})\big|_{\omega = k\frac{2\pi}{N}} \qquad 0 \le k \le N-1$$

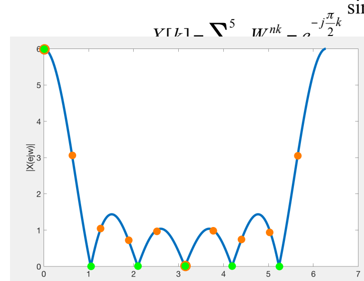
DFT Intuition



DFT vs DTFT

- Back to example

$$X[k] = \sum^{5} W^{nk} = e^{-j\frac{\pi}{2}k}\frac{\sin\left(\frac{3\pi}{5}k\right)}{\left(\frac{\pi}{10}k\right)}$$



"6-point" DFT

"10-point" DFT

Use `fftshift` to center around dc

Fast Fourier Transform Algorithms

- We are interested in efficient computing methods for the DFT and inverse DFT:

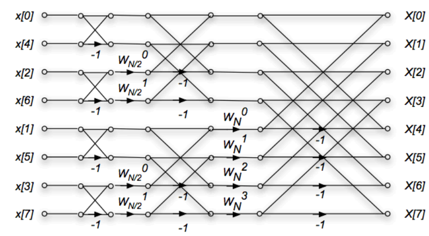
$$X[k] = \sum_{n=0}^{N-1} x[n] W_N^{kn}, \quad k = 0, \ldots, N-1$$

$$x[n] = \sum_{k=0}^{N-1} X[k] W_N^{-kn}, \quad n = 0, \ldots, N-1$$

$$W_N = e^{-j\left(\frac{2\pi}{N}\right)}.$$

Decimation-in-Time FFT

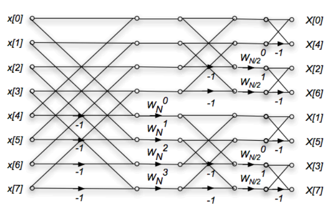
Combining all these stages, the diagram for the 8 sample DFT is:



- $3=\log_2(N)=\log_2(8)$ stages
- $4=N/2=8/2$ multiplications in each stage
  - 1st stage has trivial multiplication

Decimation-in-Frequency FFT

The diagram for and 8-point decimation-in-frequency DFT is as follows



This is just the decimation-in-time algorithm reversed!
The inputs are in normal order, and the outputs are bit reversed.

Example 1:

A long *periodic* sequence x of period $N = 2^r$ (r is an integer) is to be convolved with a finite-length sequence h of length K.

a) *Show* that the output y of this convolution (filtering) is *periodic*. What is its period?

Example 1:

A long *periodic* sequence x of period $N = 2^r$ (r is an integer) is to be convolved with a finite-length sequence h of length K.

a) *Show* that the output y of this convolution (filtering) is *periodic*. What is its period?

What information do we know?
x[n]=x[n+N]
h[n] only non-zero for $0 \le n < K$

$$y[n] = x[n] * h[n]$$

Example 1:

A long *periodic* sequence x of period $N = 2^r$ (r is an integer) is to be convolved with a finite-length sequence h of length K.

a) *Show* that the output y of this convolution (filtering) is *periodic*. What is its period?

What information do we know?
x[n]=x[n+N]
h[n] only non-zero for $0 \le n < K$

$$y[n] = x[n] * h[n]$$
$$= \sum_{m=0}^{K-1} x[n-m]h[m]$$

Example 1:

A long *periodic* sequence x of period $N = 2^r$ (r is an integer) is to be convolved with a finite-length sequence h of length K.

a) *Show* that the output y of this convolution (filtering) is *periodic*. What is its period?

What information do we know?
x[n]=x[n+N]
h[n] only non-zero for $0 \le n < K$

$$y[n] = x[n] * h[n]$$
$$= \sum_{m=0}^{K-1} x[n-m]h[m]$$

What do we need to show?
y[n]=y[n+M]

Example 1:

A long *periodic* sequence x of period $N = 2^r$ (r is an integer) is to be convolved with a finite-length sequence h of length K.

a) *Show* that the output y of this convolution (filtering) is *periodic*. What is its period?

What information do we know?
x[n]=x[n+N]
h[n] only non-zero for $0 \le n < K$

$$y[n] = x[n] * h[n]$$
$$= \sum_{m=0}^{K-1} x[n-m]h[m]$$

What do we need to show?
y[n]=y[n+M]

$$y[n+M] = \sum_{m=0}^{K-1} x[(n+M)-m]h[m]$$

M=?

Example 1:

A long *periodic* sequence x of period $N = 2^r$ (r is an integer) is to be convolved with a finite-length sequence h of length K.

a) *Show* that the output y of this convolution (filtering) is *periodic*. What is its period?

What information do we know?
x[n]=x[n+N]
h[n] only non-zero for $0 \le n < K$

$$y[n] = x[n] * h[n]$$
$$= \sum_{m=0}^{K-1} x[n-m]h[m]$$

What do we need to show?
y[n]=y[n+M]

$$y[n+N] = \sum_{m=0}^{K-1} x[(n+N)-m]h[m]$$
$$= \sum_{m=0}^{K-1} x[n-m]h[m]$$
$$= y[n]$$

Example 1:

A long *periodic* sequence x of period $N = 2^r$ (r is an integer) is to be convolved with a finite-length sequence h of length K.

a) *Show* that the output y of this convolution (filtering) is *periodic*. What is its period?
b) Let $K = mN$ where m is an integer; N is large. How would you implement this convolution *efficiently*? Explain your analysis clearly. Compare the *total number of multiplications* required in your scheme to that in the direct implementation of FIR filtering. (Consider the case $r = 10$, $m = 10$).

Example 1:

A long *periodic* sequence x of period $N = 2^r$ (r is an integer) is to be convolved with a finite-length sequence h of length K.

a) *Show* that the output y of this convolution (filtering) is *periodic*. What is its period?
b) Let $K = mN$ where m is an integer; N is large. How would you implement this convolution *efficiently*? Explain your analysis clearly. Compare the *total number of multiplications* required in your scheme to that in the direct implementation of FIR filtering. (Consider the case $r = 10$, $m = 10$).

What information do we know?

$$x[n] = \{x[0],...,x[N-1]\}$$

$$h[n] = \{h[0],...,h[K-1]\}$$

Example 1:

A long *periodic* sequence x of period $N = 2^r$ (r is an integer) is to be convolved with a finite-length sequence h of length K.

a) *Show* that the output y of this convolution (filtering) is *periodic*. What is its period?
b) Let $K = mN$ where m is an integer; N is large. How would you implement this convolution *efficiently*? Explain your analysis clearly. Compare the *total number of multiplications* required in your scheme to that in the direct implementation of FIR filtering. (Consider the case $r = 10$, $m = 10$).

What information do we know?

$$x[n] = \{x[0],...,x[N-1]\} \rightarrow \tilde{x}[n] = \sum_{r=-\infty}^{\infty} x[n-rN], \qquad \text{for all } 0 \le n < N$$

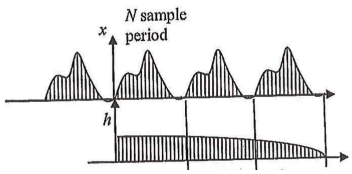
$$h[n] = \{h[0],...,h[K-1]\} = \{h[0],...,h[mN-1]\}$$

Example 1:

A long *periodic* sequence x of period $N = 2^r$ (r is an integer) is to be convolved with a finite-length sequence h of length K.

a) *Show* that the outp
periodic. What is

b) Let $K = mN$ where
you implement thi
analysis clearly. (
multiplications re
direct implementa
$r = 10$, $m = 10$).



What information do we know?

$$x[n] = \{x[0],\ldots,x[N-1]\} \rightarrow \tilde{x}[n] = \sum_{r=-\infty}^{\infty} x[n-rN], \qquad \text{for all } 0 \le n < N$$

$$h[n] = \{h[0],\ldots,h[K-1]\} = \{h[0],\ldots,h[mN-1]\}$$

Example 1:

What information do we know?

$$x[n] = \{x[0],\ldots,x[N-1]\} \rightarrow \tilde{x}[n] = \sum_{r=-\infty}^{\infty} x[n-rN], \qquad \text{for all } 0 \le n < N$$

$$h[n] = \{h[0],\ldots,h[K-1]\} = \{h[0],\ldots,h[mN-1]\}$$

$$y[n] = \{y[0],\ldots,y[N-1]\} \rightarrow \tilde{y}[n] = \sum_{r=-\infty}^{\infty} y[n-rN], \qquad \text{for all } 0 \le n < N$$

$$y[n] = \sum_{p=0}^{K-1} x[n-p]h[p]$$

Example 1:

$$\tilde{y}[n] = \sum_{p=0}^{K-1} \tilde{x}[n-p]h[p]$$

Example 1:

$$\tilde{y}[n] = \sum_{p=0}^{K-1} \tilde{x}[n-p]h[p]$$

$$= \sum_{p=0}^{mN-1} \tilde{x}[n-p]h[p]$$

Example 1:

$$\tilde{y}[n] = \sum_{p=0}^{K-1} \tilde{x}[n-p]h[p]$$

$$= \sum_{p=0}^{mN-1} \tilde{x}[n-p]h[p]$$

$$= \sum_{p=0}^{N-1} \tilde{x}[n-p]h[p] + \sum_{p=N}^{2N-1} \tilde{x}[n-p]h[p] + \sum_{p=2N}^{3N-1} \tilde{x}[n-p]h[p] + \ldots + \sum_{p=(m-1)N}^{mN-1} \tilde{x}[n-p]h[p]$$

Example 1:

$$\tilde{y}[n] = \sum_{p=0}^{K-1} \tilde{x}[n-p]h[p]$$

$$= \sum_{p=0}^{mN-1} \tilde{x}[n-p]h[p]$$

$$= \sum_{p=0}^{N-1} \tilde{x}[n-p]h[p] + \sum_{p=N}^{2N-1} \tilde{x}[n-p]h[p] + \sum_{p=2N}^{3N-1} \tilde{x}[n-p]h[p] + \ldots + \sum_{p=(m-1)N}^{mN-1} \tilde{x}[n-p]h[p]$$

$$= \sum_{p=0}^{N-1} \tilde{x}[n-p]h[p] + \sum_{p=0}^{N-1} \tilde{x}[n-(p+N)]h[p+N] + \sum_{p=0}^{N-1} \tilde{x}[n-(p+2N)]h[p+2N]$$

$$+ \ldots + \sum_{p=0}^{N-1} \tilde{x}[n-(p+(m-1)N)]h[p+(m-1)N]$$

Example 1:

$$\tilde{y}[n]=\sum_{p=0}^{N-1}\tilde{x}[n-p]h[p]+\sum_{p=0}^{N-1}\tilde{x}[n-(p+N)]h[p+N]+\sum_{p=0}^{N-1}\tilde{x}[n-(p+2N)]h[p+2N]$$
$$+\ldots+\sum_{p=0}^{N-1}\tilde{x}[n-(p+(m-1)N)]h[p+(m-1)N]$$
$$=\sum_{p=0}^{N-1}\tilde{x}[n-p]h[p]+\sum_{p=0}^{N-1}\tilde{x}[n-p]h[p+N]+\sum_{p=0}^{N-1}\tilde{x}[n-p]h[p+2N]$$
$$+\ldots+\sum_{p=0}^{N-1}\tilde{x}[n-p]h[p+(m-1)N]$$
$$=\tilde{x}[n]*\left\{h[n]\right\}_0^{N-1}+\tilde{x}[n]*\left\{h[n+N]\right\}_0^{N-1}+\tilde{x}[n]*\left\{h[n+2N]\right\}_0^{N-1}$$
$$+\ldots+\tilde{x}[n]*\left\{h[n+mN]\right\}_0^{N-1}$$
$$=\tilde{x}[n]*\left(\sum_{q=0}^{m-1}h[p+qN]\right)$$

Example 1:

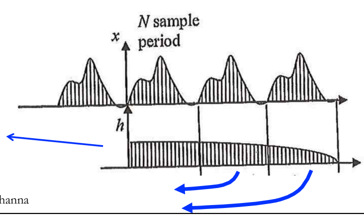
$$\tilde{y}[n]=\tilde{x}[n]*\left(\sum_{q=0}^{m-1}h[p+qN]\right)\rightarrow y[n]=x[n]*\left(\sum_{q=0}^{m-1}h[p+qN]\right)$$

Example 1:

$$\tilde{y}[n]=\tilde{x}[n]*\left(\sum_{q=0}^{m-1}h[p+qN]\right)\rightarrow y[n]=x[n]*\left(\sum_{q=0}^{m-1}h[p+qN]\right)$$

We see that the result of the convolution block of length N is a circular convolution of one period of the input with the N-block sum of the impulse response

$$\left(\sum_{q=0}^{m-1}h[p+qN]\right)$$



Example 1:

A long *periodic* sequence *x* of period $N = 2^r$ (*r* is an integer) is to be convolved with a finite-length sequence *h* of length *K*.

b) Let $K = mN$ where *m* is an integer; *N* is large. How would you implement this convolution *efficiently*? Explain your analysis clearly. Compare the *total number of multiplications* required in your scheme to that in the direct implementation of FIR filtering. (Consider the case $r = 10$, $m = 10$).

$$y[n]=x[n]*\left(\sum_{q=0}^{m-1}h[p+qN]\right)$$

What about the computation?

$N=2^{10}$, $K=2^{11}$

Example 2:

A sequence $x = \{x[n],\ n = 0,1,\ldots, N-1\}$ is given; let $X(e^{j\omega})$ be its DTFT.

a) Suppose $N = 10$. You want to evaluate both $X(e^{j2\pi\, 7/12})$ and $X(e^{j2\pi\, 3/8})$. The only computation you can perform is one DFT, on any one input sequence of your choice. Can you find the desired DTFT values? *(Show your analysis and explain clearly.)*

Example 2:

A sequence $x = \{x[n],\ n = 0,1,\ldots, N-1\}$ is given; let $X(e^{j\omega})$ be its DTFT.

a) Suppose $N = 10$. You want to evaluate both $X(e^{j2\pi\, 7/12})$ and $X(e^{j2\pi\, 3/8})$. The only computation you can perform is one DFT, on any one input sequence of your choice. Can you find the desired DTFT values? *(Show your analysis and explain clearly.)*

$$e^{j2\pi\cdot\frac{7}{12}}=e^{j2\pi\cdot\frac{14}{24}}$$
$$e^{j2\pi\cdot\frac{3}{8}}=e^{j2\pi\cdot\frac{9}{24}}$$

24-point DFT

Example 2:

A sequence $x = \{x[n], n = 0,1,..., N - 1\}$ is given; let $X(e^{j\omega})$ be its DTFT.

b) Suppose N is large. You want to obtain $X(e^{j\omega})$ at the following $2M$ frequencies:

$$\omega = \frac{2\pi}{M}m,\ \ m = 0,1,...,M-1 \quad \text{and} \quad \omega = \frac{2\pi}{M}m + \frac{2\pi}{N},\ \ m = 0,1,...,M-1$$

Here $M = 2^{\mu} << N = 2^{\nu}$, (Eg. μ=8, ν=14)

A standard radix-2 FFT algorithm is available. You may execute the FFT algorithm *once* or *more than once*, and *multiplications* and *additions* outside of the FFT are *allowed*, if necessary.

I. You want to get the $2M$ DTFT values with as few *total multiplications* as possible (*including those in the FFT*). Give explicitly the best method you can find for this, with an estimate of the *total number of multiplications* needed in terms of M and N.

II. Does your result change if extra multiplications outside of FFTs are *not* allowed?

Example 2:

$$\omega = \frac{2\pi}{M}m,\ \ m = 0,1,...,M-1 \quad \text{and} \quad \omega = \frac{2\pi}{M}m + \frac{2\pi}{N},\ \ m = 0,1,...,M-1$$

Here $M = 2^{\mu} << N = 2^{\nu}$, (Eg. μ=8, ν=14)

A standard radix-2 FFT algorithm is available. You may execute the FFT algorithm *once* or *more than once*, and *multiplications* and *additions* outside of the FFT are *allowed*, if necessary.

I. You want to get the $2M$ DTFT values with as few *total multiplications* as possible (*including those in the FFT*). Give explicitly the best method you can find for this, with an estimate of the *total number of multiplications* needed in terms of M and N.

$$X\left(e^{j\left(\frac{2\pi}{M}m+\frac{2\pi}{N}\right)}\right) = \sum_{n=0}^{N-1} x[n] e^{-j\left(\frac{2\pi}{M}m+\frac{2\pi}{N}\right)n}$$

Example 2:

$$\omega = \frac{2\pi}{M}m,\ \ m = 0,1,...,M-1 \quad \text{and} \quad \omega = \frac{2\pi}{M}m + \frac{2\pi}{N},\ \ m = 0,1,...,M-1$$

Here $M = 2^{\mu} << N = 2^{\nu}$, (Eg. μ=8, ν=14)

A standard radix-2 FFT algorithm is available. You may execute the FFT algorithm *once* or *more than once*, and *multiplications* and *additions* outside of the FFT are *allowed*, if necessary.

I. You want to get the $2M$ DTFT values with as few *total multiplications* as possible (*including those in the FFT*). Give explicitly the best method you can find for this, with an estimate of the *total number of multiplications* needed in terms of M and N.

$$X\left(e^{j\left(\frac{2\pi}{M}m+\frac{2\pi}{N}\right)}\right) = \sum_{n=0}^{N-1} x[n] e^{-j\left(\frac{2\pi}{M}m+\frac{2\pi}{N}\right)n} = \sum_{n=0}^{N-1} \underbrace{\boxed{x[n] e^{-j\frac{2\pi}{M}n}}}_{=y[n]} e^{-j\frac{2\pi}{M}nm}$$

Example 2:

$$\omega = \frac{2\pi}{M}m,\ \ m = 0,1,...,M-1 \quad \text{and} \quad \omega = \frac{2\pi}{M}m + \frac{2\pi}{N},\ \ m = 0,1,...,M-1$$

Here $M = 2^{\mu} << N = 2^{\nu}$, (Eg. μ=8, ν=14)

A standard radix-2 FFT algorithm is available. You may execute the FFT algorithm *once* or *more than once*, and *multiplications* and *additions* outside of the FFT are *allowed*, if necessary.

I. You want to get the $2M$ DTFT values with as few *total multiplications* as possible (*including those in the FFT*). Give explicitly the best method you can find for this, with an estimate of the *total number of multiplications* needed in terms of M and N.

$$X\left(e^{j\left(\frac{2\pi}{M}m+\frac{2\pi}{N}\right)}\right) = \sum_{n=0}^{N-1} x[n] e^{-j\left(\frac{2\pi}{M}m+\frac{2\pi}{N}\right)n} = \sum_{n=0}^{N-1} x[n] e^{-j\frac{2\pi}{M}n} e^{-j\frac{2\pi}{M}nm}$$

$$= \sum_{n=0}^{N-1} y[n] e^{-j\frac{2\pi}{M}nm} = Y\left(e^{j\frac{2\pi}{M}m}\right)$$

Example 2:

$$\omega = \frac{2\pi}{M}m,\ \ m = 0,1,...,M-1 \quad \text{and} \quad \omega = \frac{2\pi}{M}m + \frac{2\pi}{N},\ \ m = 0,1,...,M-1$$

Here $M = 2^{\mu} << N = 2^{\nu}$, (Eg. μ=8, ν=14)

A standard radix-2 FFT algorithm is available. You may execute the FFT algorithm *once* or *more than once*, and *multiplications* and *additions* outside of the FFT are *allowed*, if necessary.

I. You want to get the $2M$ DTFT values with as few *total multiplications* as possible (*including those in the FFT*). Give explicitly the best method you can find for this, with an estimate of the *total number of multiplications* needed in terms of M and N.

II. Does your result change if extra multiplications outside of FFTs are *not* allowed?

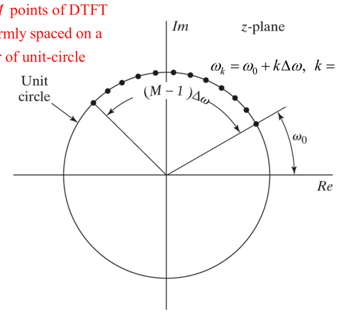
Chirp Transform Algorithm

Chirp Transform Algorithm

- Uses convolution to evaluate the DFT
- This algorithm is not optimal in minimizing any measure of computational complexity, but it has been useful in a variety of applications, particularly when implemented in technologies that are well suited to doing convolution with a fixed, pre-specified impulse response.
- The CTA is also more flexible than the FFT, since it can be used to compute *any* set of equally spaced samples of the Fourier transform on the unit circle.

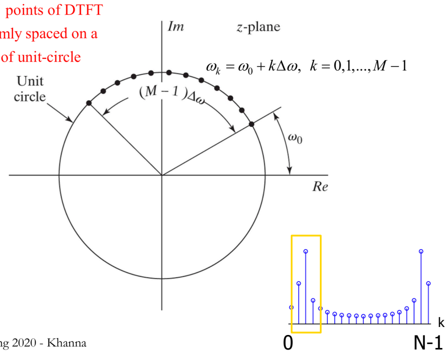
Chirp Transform Algorithm

For M points of DTFT uniformly spaced on a sector of unit-circle



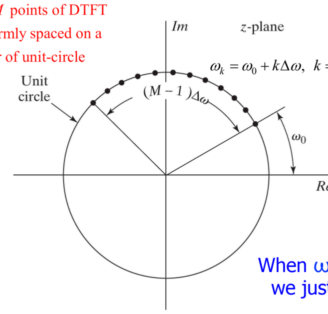
Chirp Transform Algorithm

For M points of DTFT uniformly spaced on a sector of unit-circle



Chirp Transform Algorithm

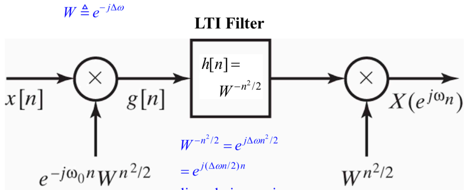
For M points of DTFT uniformly spaced on a sector of unit-circle



When ω_0=0 and M=N, we just get the DFT

Chirp Transform Algorithm

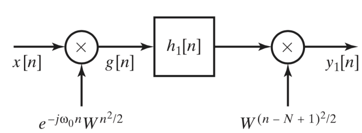
$W \triangleq e^{-j\Delta\omega}$



$W^{-n^2/2} = e^{j\Delta\omega n^2/2}$
$= e^{j(\Delta\omega n/2)n}$
linearly increasing frequency "chirp"

Causal FIR CTA

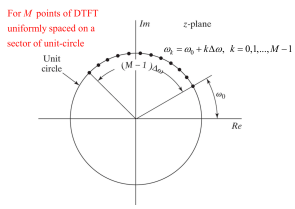
$$h_1[n] = \begin{cases} W^{-(n-N+1)^2/2}, & n = 0, 1, \ldots, M+N-2, \\ 0, & \text{otherwise.} \end{cases}$$



$$X(e^{j\omega_n}) = y_1[n+N-1], \qquad n = 0, 1, \ldots, M-1.$$

Example: Chirp Transform Parameters

- We have a finite-length sequence x[n] that is nonzero only on the interval n = 0, ..., 25, (Length N=26) and we wish to compute 16 samples of the DTFT $X(e^{j\omega})$ at the frequencies $\omega_k = 2\pi/27 + 2\pi k/1024$ for k = 0, . . . , 15.



Circular Convolution

Linear Convolution with aliasing!

Circular Convolution

- Circular Convolution:

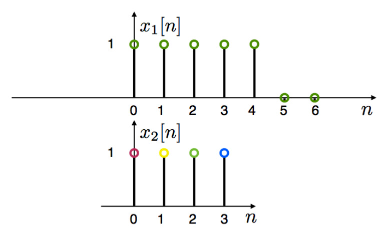
$$x_1[n] \text{ Ⓝ } x_2[n] \triangleq \sum_{m=0}^{N-1} x_1[m]x_2[((n-m))_N]$$

For two signals of length N

Note: Circular convolution is commutative

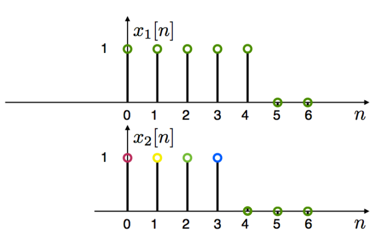
$$x_2[n] \text{ Ⓝ } x_1[n] = x_1[n] \text{ Ⓝ } x_2[n]$$

Compute Circular Convolution Sum



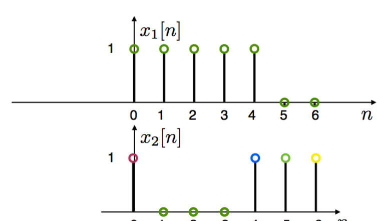
$$x_1[n] \text{ Ⓝ } x_2[n] \triangleq \sum_{m=0}^{N-1} x_1[m]x_2[((n-m))_N]$$

Compute Circular Convolution Sum



$$x_1[n] \text{ Ⓝ } x_2[n] \triangleq \sum_{m=0}^{N-1} x_1[m]x_2[((n-m))_N]$$

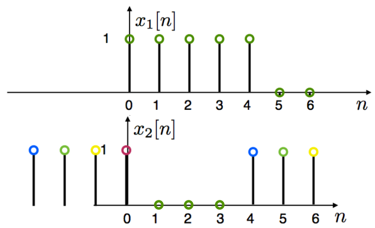
Compute Circular Convolution Sum



$$x_1[n] \text{ Ⓝ } x_2[n] \triangleq \sum_{m=0}^{N-1} x_1[m]x_2[((n-m))_N]$$

Compute Circular Convolution Sum

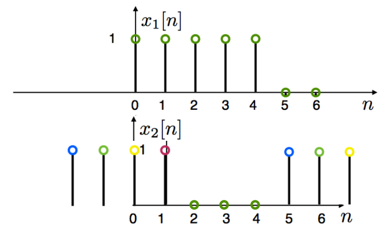
y[0]=2



$$x_1[n] \circledN x_2[n] \triangleq \sum_{m=0}^{N-1} x_1[m]x_2[((n-m))_N]$$

Compute Circular Convolution Sum

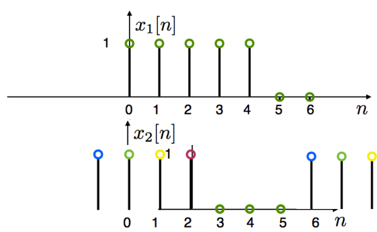
y[0]=2
y[1]=2



$$x_1[n] \circledN x_2[n] \triangleq \sum_{m=0}^{N-1} x_1[m]x_2[((n-m))_N]$$

Compute Circular Convolution Sum

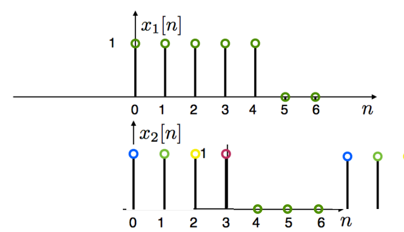
y[0]=2
y[1]=2
y[2]=3



$$x_1[n] \circledN x_2[n] \triangleq \sum_{m=0}^{N-1} x_1[m]x_2[((n-m))_N]$$

Compute Circular Convolution Sum

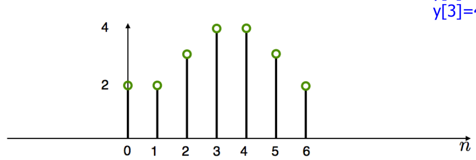
y[0]=2
y[1]=2
y[2]=3
y[3]=4



$$x_1[n] \circledN x_2[n] \triangleq \sum_{m=0}^{N-1} x_1[m]x_2[((n-m))_N]$$

Result

y[0]=2
y[1]=2
y[2]=3
y[3]=4



$$x_1[n] \circledN x_2[n] \triangleq \sum_{m=0}^{N-1} x_1[m]x_2[((n-m))_N]$$

Linear Convolution

- We start with two non-periodic sequences:

$$x[n] \quad 0 \le n \le L-1$$
$$h[n] \quad 0 \le n \le P-1$$

  - E.g. x[n] is a signal and h[n] a filter's impulse response
- We want to compute the linear convolution:

$$y[n] = x[n] * h[n] = \sum_{m=0}^{L-1} x[m]h[n-m]$$

  - y[n] is nonzero for $0 \le n \le L+P-2$ with length M=L+P-1

Requires LP multiplications

Linear Convolution via Circular Convolution

- Zero-pad x[n] by P-1 zeros

$$x_{zp}[n] = \begin{cases} x[n] & 0 \le n \le L-1 \\ 0 & L \le n \le L+P-2 \end{cases}$$

- Zero-pad h[n] by L-1 zeros

$$h_{zp}[n] = \begin{cases} h[n] & 0 \le n \le P-1 \\ 0 & P \le n \le L+P-2 \end{cases}$$

- Now, both sequences are length M=L+P-1

Circular Conv. via Linear Conv. w/ Aliasing

- If the DTFT $X(e^{j\omega})$ of a sequence x[n] is sampled at N frequencies $\omega_k = 2\pi k/N$, then the resulting sequence X[k] corresponds to the periodic sequence

$$\tilde{x}[n] = \sum_{r=-\infty}^{\infty} x[n - rN].$$

- And $X[k] = \begin{cases} X(e^{j(2\pi k/N)}), & 0 \le k \le N-1, \\ 0, & \text{otherwise}, \end{cases}$ is the DFT of one period given as

$$x_p[n] = \begin{cases} \tilde{x}[n], & 0 \le n \le N-1, \\ 0, & \text{otherwise}. \end{cases}$$

Circular Conv. via Linear Conv. w/ Aliasing

$$x_p[n] = \begin{cases} \tilde{x}[n], & 0 \le n \le N-1, \\ 0, & \text{otherwise}. \end{cases}$$

- If x[n] has length less than or equal to N, then $x_p[n]=x[n]$
- However if the length of x[n] is greater than N, this might not be true and we get aliasing in time
  - N-point convolution results in N-point sequence

Circular Conv. via Linear Conv. w/ Aliasing

- Given two N-point sequences ($x_1[n]$ and $x_2[n]$) and their N-point DFTs ($X_1[k]$ and $X_2[k]$)
- The N-point DFT of $x_3[n]=x_1[n]*x_2[n]$ is defined as

$$X_3[k] = X_3(e^{j(2\pi k/N)})$$

Circular Conv. via Linear Conv. w/ Aliasing

- Given two N-point sequences ($x_1[n]$ and $x_2[n]$) and their N-point DFTs ($X_1[k]$ and $X_2[k]$)
- The N-point DFT of $x_3[n]=x_1[n]*x_2[n]$ is defined as

$$X_3[k] = X_3(e^{j(2\pi k/N)})$$

- And $X_3[k]=X_1[k]X_2[k]$, where the inverse DFT of $X_3[k]$ is

$$x_{3p}[n] = \begin{cases} \sum_{r=-\infty}^{\infty} x_3[n - rN], & 0 \le n \le N-1, \\ 0, & \text{otherwise}, \end{cases}$$

Circular Conv. as Linear Conv. w/ Aliasing

$$x_{3p}[n] = \begin{cases} \sum_{r=-\infty}^{\infty} x_3[n - rN], & 0 \le n \le N-1, \\ 0, & \text{otherwise}, \end{cases}$$

Circular Conv. as Linear Conv. w/ Aliasing

$$x_{3p}[n] = \begin{cases} \sum_{r=-\infty}^{\infty} x_3[n - rN], & 0 \le n \le N-1, \\ 0, & \text{otherwise}, \end{cases}$$

- Thus

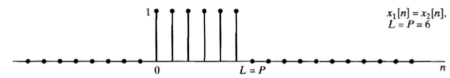
$$x_{3p}[n] = \begin{cases} \sum_{r=-\infty}^{\infty} x_1[n-rN] * x_2[n-rN] & 0 \le n \le N-1 \\ 0 & \text{else} \end{cases}$$

$$x_{3p}[n] = x_1[n] \circledN x_2[n]$$

- The N-point circular convolution is the sum of linear convolutions shifted in time by N

Example 1:

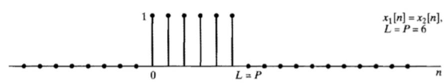
- Let



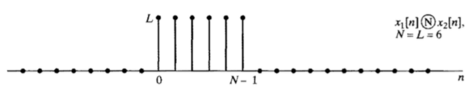
- The N=L=6-point circular convolution results in

Example 1:

- Let

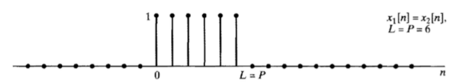


- The N=L=6-point circular convolution results in



Example 1:

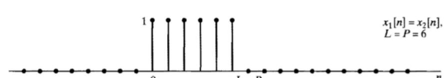
- Let



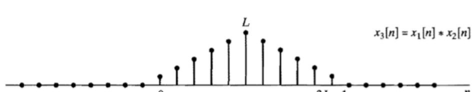
- The linear convolution results in

Example 1:

- Let

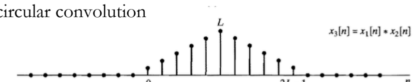


- The linear convolution results in

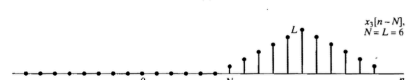


Example 1:

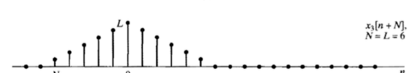
- The sum of N-shifted linear convolutions equals the N-point circular convolution



(b)

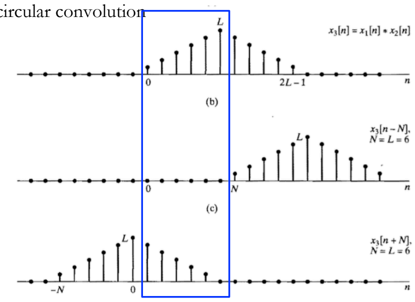


(c)



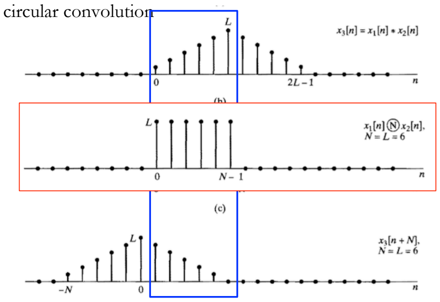
Example 1:

- The sum of N-shifted linear convolutions equals the N-point circular convolution



Example 1:

- The sum of N-shifted linear convolutions equals the N-point circular convolution

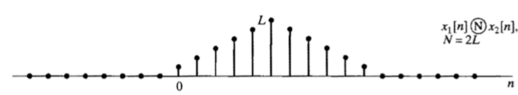


Example 1:

- If I want the circular convolution and linear convolution to be the same, what do I do?

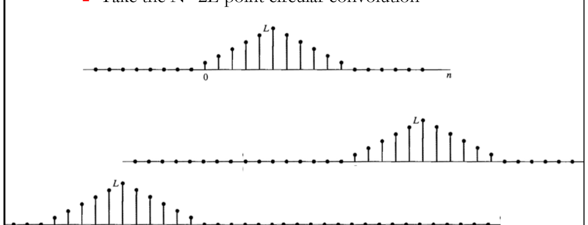
Example 1:

- If I want the circular convolution and linear convolution to be the same, what do I do?
  - Take the N=2L-point circular convolution



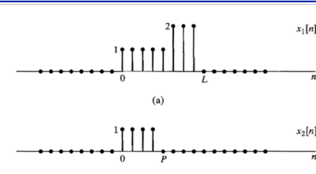
Example 1:

- If I want the circular convolution and linear convolution to be the same, what do I do?
  - Take the N=2L-point circular convolution



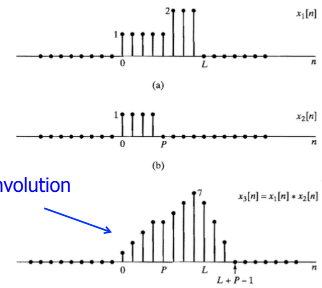
Example 2:

- Let



Example 2:

- Let

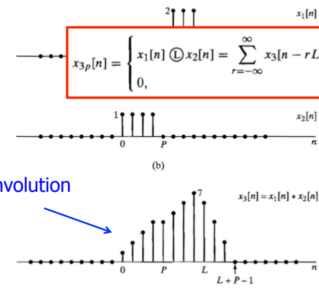


Linear convolution

- What does the L-point circular convolution look like?

Example 2:

- Let



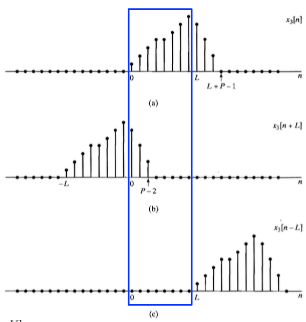
$$x_{3p}[n] = \begin{cases} x_1[n] \, \text{Ⓛ} \, x_2[n] = \sum_{r=-\infty}^{\infty} x_3[n-rL], & 0 \le n \le L-1, \\ 0, & \text{otherwise.} \end{cases}$$

Linear convolution

- What does the L-point circular convolution look like?

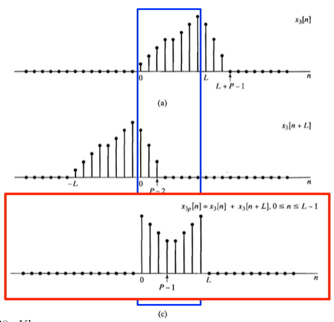
Example 2:

- The L-shifted linear convolutions



Example 2:

- The L-shifted linear convolutions



$x_{3p}[n] = x_3[n] + x_3[n+L], \; 0 \le n \le L-1$

Big Ideas

- Discrete Fourier Transform (DFT)
  - For finite signals assumed to be zero outside of defined length
  - N-point DFT is sampled DTFT at N points
  - Useful properties allow easier linear convolution
- Fast Fourier Transform
  - Enable computation of an N-point DFT (or DFT^{-1}) with the order of just $N \cdot \log_2 N$ complex multiplications.
- Fast Convolution Methods
  - Use circular convolution (i.e DFT) to perform fast linear convolution
    - Overlap-Add, Overlap-Save
  - Circular convolution is linear convolution with aliasing
- Design DSP methods to minimize computations!

Admin

- Read adaptive filter reference for next lecture
  - Find on course calendar
- Project: Adaptive Filtering
  - Handout posted over the weekend
  - Work in pairs
    - Use Piazza to find partners
  - Will discuss next lecture
    - Read handout linked on calendar before class!
    - Additional resources in Canvas Files
  - Due 4/28
