

ESE532: System-on-a-Chip Architecture

Day 19: November 9, 2020
Verification 1

Penn ESE532 Fall 2020 -- DeHon

Today

- Part 1:
 - Motivation
 - Challenge and Coverage
- Part 2:
 - Golden Model / Reference Specification
- Part 3:
 - Automation and Regression

Penn ESE532 Fall 2020 -- DeHon

2

Message

- If you don't test it, it doesn't work.
- Verification is important and challenging
- Demands careful thought
 - Tractable and adequate coverage
- Value to a simple functional reference
- **Must** be automated and rerun with changes
 - Often throughout lifecycle of design

Penn ESE532 Fall 2020 -- DeHon

3

Goal

- Assure design works correctly
 - Not fail and lose consumer confidence.
 - ...or lose them money, privacy, service availability....
 - Not kill anyone
 - Ethical issue
 - Not lose points on your grade 😊

Penn ESE532 Fall 2020 -- DeHon

4

Challenge

- Designs are complex
 - Many ways things can go wrong
 - Many *subtle* ways things can go wrong
 - Many tricky interactions
- Designs are often poorly specified
 - Complex to completely specify

Penn ESE532 Fall 2020 -- DeHon

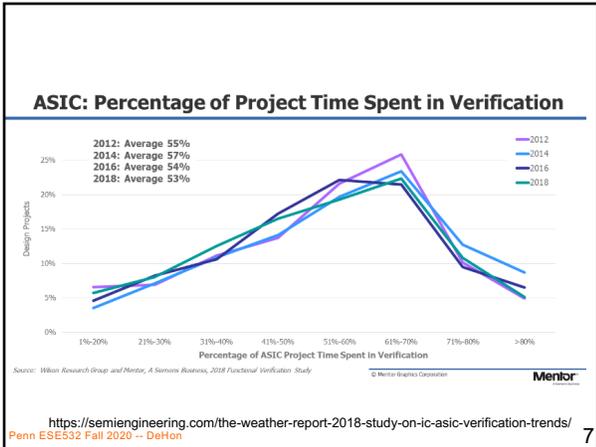

5

Verification

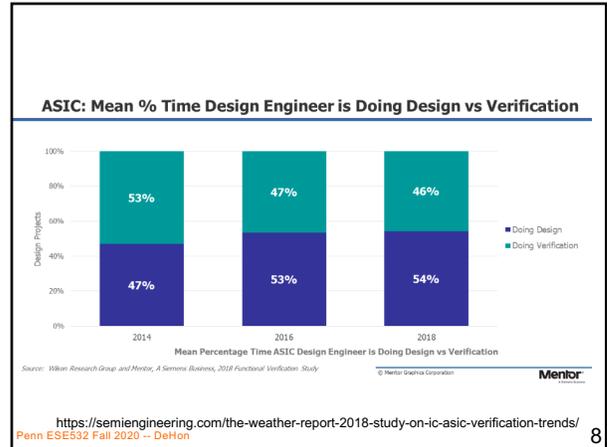

- Often dominant cost in product
 - Requires most manpower (cost)
 - Takes up most of schedule
 - In the critical path to making money

Penn ESE532 Fall 2020 -- DeHon

6

7

8

Correctness?

- How do we define correctness for a design?
- How do we know the design is correct?
- How do we know the design remains correct when?
 - Add a some feature
 - Perform an optimization
 - Fix a bug

Penn ESE532 Fall 2020 -- DeHon

9

Life Cycle

- Design
 - specify what means to be correct
- Development
 - Implement and refine
 - Fix bugs
 - Optimize
- Operation and Maintenance
 - Discover bugs, new uses and interaction
 - Fix and provide updates
- Upgrade/revision

Penn ESE532 Fall 2020 -- DeHon

10

Testing and Coverage

Penn ESE532 Fall 2020 -- DeHon

11

Strawman Testing

Validate the design by testing it:

- Create a set of test inputs
- Apply test inputs
- Collect response outputs
- Check if outputs match expectations

Penn ESE532 Fall 2020 -- DeHon

12

Strawman: Inputs and Outputs

Validate the design by testing it:

- Create a set of test inputs
 - How do we generate an adequate set of inputs? (know if a set is adequate?)
- Apply test inputs
- Collect response outputs
- Check if outputs match expectations
 - How do we know if outputs are correct?

Penn ESE532 Fall 2020 -- DeHon

13

Try 1: Inputs and Outputs

- Create a set of test inputs
 - How do we generate an adequate set of inputs? (know if a set is adequate?)
 - All possible inputs
- Check if outputs match expectations
 - How do we know if outputs are correct?
 - Manually identify correct output

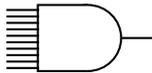

Penn ESE532 Fall 2020 -- DeHon

14

How many input cases?

Combinational:

- 10-input AND gate?
- Any N-input combinational function?

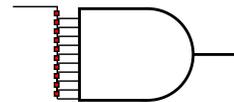

Penn ESE532 Fall 2020 -- DeHon

15

Add Pipelining

- The output doesn't correspond to the input on a single cycle
- Need to think about inputs sequences to output sequences
- How many input cases?

Penn ESE532 Fall 2020 -- DeHon

16

Add Pipelining

- The output doesn't correspond to the input on a single cycle
- Need to think about inputs sequences to output sequences
- How many input cases for a generic acyclic circuit?
 - Depth d
 - Inputs N

Penn ESE532 Fall 2020 -- DeHon

17

Add Feedback State

- When have state
 - Different inputs can produce different outputs
- Behavior depends on state
- Need to reason about all states the design can be in

Penn ESE532 Fall 2020 -- DeHon

18

How many input cases?

- Process 1000 Byte packet
 - No state kept between packets
- Process 1000 Byte packets
 - Keep 32b of state between packets

Penn ESE532 Fall 2020 -- DeHon

19

Observation

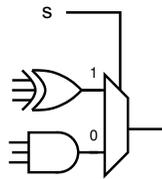

- Cannot afford
 - Exhaustively generate input cases
 - Manual write output expectations
- Will need to be smarter about test case selection

Penn ESE532 Fall 2020 -- DeHon

20

Structural Simplifications

- How many cases if treat as 7-input function?
- How many useful cases
 - If hold s at 0?
 - If hold s at 1?
 - Together total cases?

Penn ESE532 Fall 2020 -- DeHon

21

Useful Test Cases

```
int fun(int s,a,b,c,d) {  
  if (s>20)  
    if (s>100)  
      return(a+b); else return(b+c);  
  else  
    if (s<0)  
      return(c+d); else return(a+d);  
}
```

What values of s will be interesting? --- likely to exhibit different behavior?

When s=10, what values of a, b, c, d interesting? -- likely to help verify/debug?

Penn ESE532 Fall 2020 -- DeHon

22

Finite State Machine

- What input cases should we try to exercise for an FSM? (goal for test cases)

```
int state;  
while (true) {  
  switch (state) {  
    case (ST1): out=1; state=ST2; break;  
    case (ST2): if (in>0) {out=2; state=ST3;}  
               else {out=0; state=ST2;} break;  
    case (ST3):
```

Penn ESE532 Fall 2020 -- DeHon

23

Coverage

- Do our tests execute every line of code?
 - What percentage of the code is exercised?
- Gate-level designs
 - Can we toggle every gate output?
- Necessary but not sufficient
 - Not exercised or not toggled, definitely not testing some functionality
 - Remember: If you don't test it, it doesn't work.
- Measurable

Penn ESE532 Fall 2020 -- DeHon

24

So far...

- Identifying test stimulus important and tricky
 - Cannot generally afford exhaustive
 - Need understand/exploit structure
- Coverage metrics a start
 - Not complete answer

Reference Specification (Golden Model)

Part 2

Strawman: Inputs and Outputs

Validate the design by testing it:

- Create a set of test inputs
 - How do we generate an adequate set of inputs? (know if a set is adequate?)
- Apply test inputs
- Collect response outputs
- Check if outputs match expectations
 - How do we know if outputs are correct?

Problem

- Manually writing down results for all input cases
 - Tedious
 - Error prone
 - ...simply not viable for large number cases need to cover
 - Definitely not viable exhaustive
 - ...and still not viable when select intelligently

Specification Model

- Ideally, have a function that can
 - compute the correct output
 - for any input sequence
- "Gold Standard" – an oracle
 - Whatever the function says is truth
- Could be another program
 - Written in a different language? Same language?

Testing with Reference Specification

Validate the design by testing it:

- Create a set of test inputs
- Apply test inputs
 - To implementation under test
 - To reference specification
- Collect response outputs
- Check if outputs match

Test against Specification

- Relieved ourselves of writing outputs
- Still have to select input cases
 - Can freely use larger set since not responsible for manually generating output match

Penn ESE532 Fall 2020 -- DeHon

31

Random Inputs

- Can use random inputs
 - Since can generate expected output for any case
- Use coverage metric to see how well random inputs are exercising the code
- Can be particularly good to identify interactions and corner cases didn't think of manually
- Still unlikely to generate very obscure cases

Penn ESE532 Fall 2020 -- DeHon

32

Random inputs

Combinational:
Expected number inputs
to cause output to toggle?

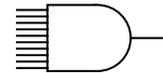

- 10-input AND gate?
- Any N-input combinational function?

Penn ESE532 Fall 2020 -- DeHon

33

Random inputs

Combinational:
Expected number inputs
to cause output to toggle?

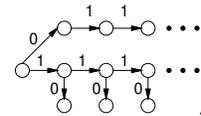

- 10-input AND gate?
- Any N-input combinational function?

$$P(\text{need more than } m) = ((2^N - 1) / 2^N)^m$$

$$0.5 = (1023 / 1024)^m$$

$$m \sim 709$$

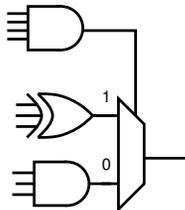

Penn ESE532 Fall 2020 -- DeHon

34

Random Inputs

- Expected number of tests to exercise both cases?
 - Compare exhaustive

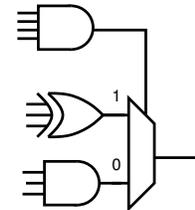

Penn ESE532 Fall 2020 -- DeHon

35

Random Inputs

- Expected number of tests to exercise both cases?
 - Compare exhaustive

- $P(\text{AND4 } 1) = 1/16$
- $P(\text{xor has } 1) = 1/2$
- $P(\text{AND4 } 1) = 15/16$
- $P(\text{AND3 } 1) = 1/8$

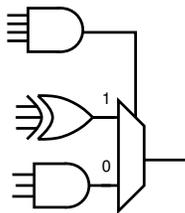

- $P(\text{get } 1) = (1/16) * (1/2) + (15/16) * (1/8) \sim 0.15$
- 4 or 5 likely to generate a toggle

Penn ESE532 Fall 2020 -- DeHon

36

Random Inputs

- What would we like to happen to reduce?
 - What would we select manually?

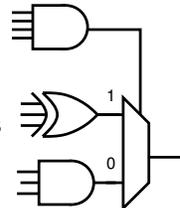

Penn ESE532 Fall 2020 -- DeHon

37

Random Inputs

- Expected number of tests to exercise both cases?
 - Compare exhaustive
- $P(\text{AND4 } 1) = 1/16$
- So, only test xor 1/16 cycles
 - About 10 tries to select 1 input
 - Then need 2–4 such cases to get both cases through xor

Penn ESE532 Fall 2020 -- DeHon

38

Random Testing

- Completely random may be just as bad as exhaustive
 - Expected time to exercise interesting piece of code
 - Expected time to produce a legal input
 - E.g. – random packets will almost always have erroneous checksums
 - E.g. random bytes won't generate duplicate chunks, or much opportunity for LZW compression

Penn ESE532 Fall 2020 -- DeHon

39

Biased Random

- Non-uniform random generation of inputs
 - Compute checksums correctly most of the time
 - Control rate and distribution of checksum errors
- Randomize properties of input, E.g.
 - Lengths of repeated sequences
 - Distance between repeated sequences
 - Edit sequence applied to differentiate files

Penn ESE532 Fall 2020 -- DeHon

40

Testing with Reference Specification

Validate the design by testing it:

- Create a set of test inputs
- Apply test inputs
 - To implementation under test
 - To reference specification
- Collect response outputs
- Check if outputs match

Penn ESE532 Fall 2020 -- DeHon

41

Specification

- Where would we get a reference specification?
 - and why should we trust it?
- Isn't this just another design that can be equally buggy?

Penn ESE532 Fall 2020 -- DeHon

42

Standard

- Many standards includes a reference implementation.

Existing Product

- Many times there's an existing product or open-source implementation...

Develop Specification

- Maybe develop a simple, functional implementation as part of early design

Specification Correct?

- How would we know the specification is correct? -- why should we trust it?
 - Simpler/smaller
 - Less opportunity for bugs
 - Written for function/clarity not performance
 - Different
 - Ok as long as reference and implementation don't have same bugs
 - Debug and test them against each other

Common Bugs

- Combinational (for simplicity)
- 10 input function
- Assume two specifications have 1% error rate (1% of input cases wrong)
- Assume independent
 - (key assumption – weaker to extent wrong)
- Probability of both giving same wrong result?
 - For a particular input case?
 - Across all input cases?

Window Filter

Day 13

- Compute based on neighbors
- for (y=0;y<YMAX;y++)
for (x=0;x<XMAX;x++)
o[y][x]=F(d[y-1][x-1],d[y-1][x],d[y-1][x+1],
d[y][x-1],d[y][x],d[y][x+1],
d[y+1][x-1],d[y+1][x],d[y+1][x+1]);

Window Filter

Day 13

- Single read and write from dym, dy
- for (y=0;y<YMAX;y++)
for (x=0;x<XMAX;x++) {
dypxm=dypx; dypx=dnew; dnew=d[y+1][x+1];
dyxm=dyx; dyx=dyxp; dyxp=dy[x+1];
dymxm=dymx; dymx=dymxp; dymxp=dym[x+1];
o[y][x]=F(dymxm,dymx,dymxp,
dyxm,dyx,dyxp,
dypxm,dypx,dnew);
dym[x-1]=dyxm;dy[x-1]=dypxm; }

Penn ESE532 Fall 2020 -- DeHon

49

Simpler Functional

- Other examples of functional specification being simpler than implementation?

Penn ESE532 Fall 2020 -- DeHon

50

Simpler Functional

- Sequential vs. parallel
- Unpipelined vs. pipelined
- Simple algorithm
 - Brute force?
- No data movement optimizations
- Use robust, mature (well-tested) building blocks

Penn ESE532 Fall 2020 -- DeHon

51

Testing with Reference Specification

Validate the design by testing it:

- Create a set of test inputs
- Apply test inputs
 - To implementation under test
 - To reference specification
- Collect response outputs
- Check if outputs match

Penn ESE532 Fall 2020 -- DeHon

52

Coverage

- Of specification or implementation?
 - Almost certainly both
- Specification may have a case split that implementation doesn't have
 - E.g. handle exceptional case
- Implementation typically have many more cases to handle in general

Penn ESE532 Fall 2020 -- DeHon

53

Automation and Regression

Part 3

Penn ESE532 Fall 2020 -- DeHon

54

Automated

- Testing suite **must** be automated
 - Single script or make build to run
 - Just start the script
 - Runs through all testing and comparison without manual interaction
 - Including scoring and reporting a single pass/fail result
 - Maybe a count of failing cases

Penn ESE532 Fall 2020 -- DeHon

55

Regression Test

- Regression Test -- Suite of tests to run and validate functionality
- To identify if your implementation has “regressed” – returned to a previously buggy state

Penn ESE532 Fall 2020 -- DeHon

56

Regression Tests

- One big test or many small tests?
- Benefit of many small tests?
- Benefit of big test(s)?

Penn ESE532 Fall 2020 -- DeHon

57

Automation Mandatory

- Will run regression suite repeatedly during Life Cycle
 - Every change
 - As optimize
 - Every bug fix

Penn ESE532 Fall 2020 -- DeHon

58

Life Cycle

- Design
 - specify what means to be correct
- Development
 - Implement and refine
 - Fix bugs
 - optimize
- Operation and Maintenance
 - Discover bugs, new uses and interaction
 - Fix and provide updates
- Upgrade/revision

Penn ESE532 Fall 2020 -- DeHon

59

Automation Value

- Engineer time is bottleneck
 - Expensive, limited resource
 - Esp. the engineer(s) that understand what the design should do
- Cannot spend that time evaluating/running tests
- Reserve it for debug, design, creating tests
- Capture knowledge in tools and tests

Penn ESE532 Fall 2020 -- DeHon

60

When find a bug

- If regression suite didn't originally find it
 - Add a test (expand regression suite) so will have a test to cover
- Make sure won't miss it again
- Test suite monotonically improving

Penn ESE532 Fall 2020 -- DeHon

61

When add a feature

- Add a test to validate that feature
 - And interaction with existing functionality
- Maybe add the test first...
 - See test identifies lack of feature before add functionality
 - ...then see (correctly added) feature satisfies test

Penn ESE532 Fall 2020 -- DeHon

62

Continuous Integration

- When commit code to shared repo (git, svn)
 - Build and run regression suite
 - Perhaps before allow commit
 - Guarantee not break good version
 - Or, at least, know how functional/broken the current version is
- Alternately, nightly regression
 - Automation to check out, build, run tests

Penn ESE532 Fall 2020 -- DeHon

63

Regression Test Size

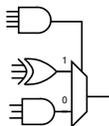

- Want to be comprehensive
 - More tests better....
- Want to run in tractable time
 - Few minutes once make change or when checkin
 - Cannot run for weeks or months
 - Might want to at least run overnight
- Sometimes forced to subset
 - Small, focused subset for immediate test
 - Comprehensive test for full validation

Penn ESE532 Fall 2020 -- DeHon

64

Unit Tests

- Regression for individual components
- Good to validate independently
- Lower complexity
 - Fewer tests
 - Complete quickly
- Make sure component(s) working before run top-level design tests
 - One strategy for long top-level regression

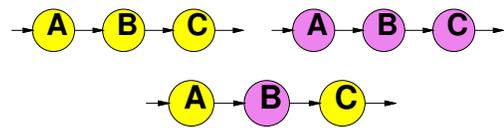

Penn ESE532 Fall 2020 -- DeHon

65

Functional Scaffolding

- If functional decomposed into components like implementation
- Replace individual components with implementation
 - Use reference/functional spec for rest

Penn ESE532 Fall 2020 -- DeHon

66

Functional Scaffolding

- If functional decomposed into components like implementation
- Replace individual components with implementation
 - Use reference/functional spec for rest
- Independent test of integration for that module

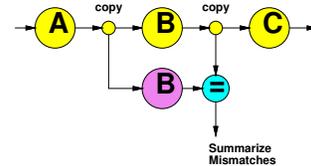

Penn ESE532 Fall 2020 -- DeHon

67

Functional Scaffolding

- If functional decomposed into components like implementation
- Run reference component and implementation together and check outputs

Penn ESE532 Fall 2020 -- DeHon

68

Decompose Specification

- Should specification decompose like implementation?
 - ultimate golden reference
 - Only if that decomposition is simplest
- But, worth refining
 - Golden reference simplest
 - Intermediate functional decomposed
 - Validate it versus golden
 - Still simpler than final implementation
 - Then use with implementation

Penn ESE532 Fall 2020 -- DeHon

69

Big Ideas

- Testing
 - Designs are complicated, need extensive validation – *If you don't test it, it doesn't work.*
 - Exhaustive testing not tractable
 - Demands care
 - Coverage one tool for helping identify
- Reference specification as “gold” standard
 - Simple, functional
- Must automate regression
 - Use regularly throughout life cycle

Penn ESE532 Fall 2020 -- DeHon

70

Admin

- Feedback (including P1)
- No new required reading for Wednesday
- P2 due Friday

Penn ESE532 Fall 2020 -- DeHon

71
