

ESE532: System-on-a-Chip Architecture

Day 2: September 9, 2020
Analysis, Metrics, and Bottlenecks

Work Preclass
Lecture start 10:35am
(preclass, feedback linked to syllabus)

Penn ESE532 Spring 2020 -- DeHon

Today: Analysis

- How do we quickly estimate what's possible?
 - Before developing a complete solution
 - less effort than developing complete solution
- How should we attack the problem?
 - Achieve the performance, energy goals?
- When we don't like the performance we're getting, how do we understand it?
- Where should we spend our time?

Penn ESE532 Spring 2020 -- DeHon

2

Today: Analysis

- Part 1: Key Terms and Concepts
 - Throughput
 - Latency
 - Bottleneck
- Part 2: Broader view
 - Bottleneck
 - Computation as a Graph, Sequence
 - Critical Path
- Part 3: Time and Space
- Part 4: Limits
 - Resource Bound
 - And Critical Path Bound
 - 90/10 Rule (time permitting)

Penn ESE532 Spring 2020 -- DeHon

3

Message for Day

- Identify the **Bottleneck**
 - May be in compute, I/O, memory, data movement
- Focus and reduce/remove bottleneck
 - More efficient use of resources
 - More resources
- Repeat

Penn ESE532 Spring 2020 -- DeHon

4

Latency vs. Throughput

- **Latency:** Delay from inputs to output(s)
- **Throughput:** Rate at which can produce new set of outputs
 - (alternately, can introduce new set of inputs)

Penn ESE532 Spring 2020 -- DeHon

5

Preclass Washer/Dryer Example

- 10 shirt capacity
- 1 Washer Takes 30 minutes
- 1 Dryer Takes 60 minutes
- How long to do one load of wash?
 - → Wash latency
- Cleaning Throughput?

Penn ESE532 Spring 2020 -- DeHon

6

Pipeline Concurrency

- Break up the computation graph into stages
 - Allowing us to
 - reuse resources for new inputs (data),
 - while older data is still working its way through the graph
 - Before it has exited graph
 - Throughput $> (1/\text{Latency})$
- Relate liquid in pipe
 - Doesn't wait for first drop of liquid to exit far end of pipe before accepting second drop

Penn ESE532 Spring 2020 -- DeHon

7

Escalator

Image Source: https://commons.wikimedia.org/wiki/File:Tanforan_Target_escalator_1.JPG

Penn ESE532 Spring 2020 -- DeHon

8

Escalator

- Moves 2 ft/second
- Assume for simplicity one person can step on escalator each second
- Escalator travels 30 feet (vertical and horizontal)
- Latency of escalator trip?
- Throughput of escalator: people/hour ?

Penn ESE532 Spring 2020 -- DeHon

9

Bottleneck

- What is the rate limiting item?
 - Resource, computation,

Penn ESE532 Spring 2020 -- DeHon

10

Preclass Washer/Dryer Example

- 1 Washer Takes 30 minutes
 - Isolated throughput 20 shirts/hour
- 1 Dryer Takes 60 minutes
 - Isolated throughput 10 shirts/hour
- Where is bottleneck in our cleaning system?

Penn ESE532 Spring 2020 -- DeHon

11

Preclass Washer/Dryer Example

- 1 Washer \$500
 - Isolated throughput 20 shirts/hour
- 1 Dryer \$500
 - Isolated throughput 10 shirts/hour
- How do we increase throughput with \$500 investment

Penn ESE532 Spring 2020 -- DeHon

12

Preclass Washer/Dryer Example

- 1 Washer \$500
 - Isolated throughput 20 shirts/hour
- 2 Dryers \$500
 - Isolated single dryer throughput 10 shirts/hour

• Latency?
• Throughput?

13

Penn ESE532 Spring 2020 -- DeHon

Preclass Washer/Dryer Example

- 1 Washer \$500
 - Isolated throughput 20 shirts/hour
- 2 Dryers \$500
 - Isolated single dryer throughput 10 shirts/hour

• Able to double the throughput without doubling system cost

14

Penn ESE532 Spring 2020 -- DeHon

Preclass Stain Example

- 1 Washer Takes 30 minutes
 - Isolated throughput 20 shirts/hour
- 1 Dryer Takes 60 minutes
 - Isolated throughput 10 shirts/hour
- Shirt need 3 wash cycles

• Latency?
• Throughput?
– (assuming reuse single washer)

15

Penn ESE532 Spring 2020 -- DeHon

Beyond Computation

(Part 2: Broader View)

16

Penn ESE532 Spring 2020 -- DeHon

Bottleneck

- May be anywhere in path
 - I/O, compute, memory, data movement

17

Penn ESE532 Spring 2020 -- DeHon

Bottleneck

- Where bottleneck?

18

Penn ESE532 Spring 2020 -- DeHon

Bottleneck

- Where bottleneck?

Penn ESE532 Spring 2020 -- DeHon

19

Bottleneck

- Where bottleneck?

Penn ESE532 Spring 2020 -- DeHon

20

Feasibility / Limits

- First things to understand
 - Obvious limits in system?
- Impossible?
- Which aspects will demand efficient mapping?
- Where might there be spare capacity?

Penn ESE532 Spring 2020 -- DeHon

21

Generalizing

(to more general task graphs)

Penn ESE532 Spring 2020 -- DeHon

22

Computation as Graph

- Shown "simple" graphs (pipelines) so far
- $Y = (A+B) * (C+D)$
- $Z = (C+D) * E$

Note: HW2 ask you to draw a dataflow graph.
Here's an example...more to come.

Penn ESE532 Spring 2020 -- DeHon

23

Computation as Graph

- Nodes have multiple input/output edges
- Edges may fanout
 - Results go to multiple successors

Penn ESE532 Spring 2020 -- DeHon

24

Computation as Sequence

- Shown “simple” graphs (pipelines) so far
- $Y=(A+B)*(C+D)$
- $Z=(C+D)*E$

$$T1=A+B$$

$$T2=C+D$$

$$Y=T1*T2$$

$$Z=T1*E$$

Penn ESE532 Spring 2020 -- DeHon

25

Computation as Graph

$$Y=Ax^2+Bx+C$$

$$T1=x*x$$

$$T2=A*T1$$

$$T3=B*x$$

$$T4=T2+T3$$

$$Y=C+T4$$

Penn ESE532 Spring 2020 -- DeHon

26

Computation as Graph

- Latency multiply = 1
- Latency add = 1/3
- Latency from B to output?
- Latency from x to output?
 - Through Ax^2 ?
 - Through Bx ?

Penn ESE532 Spring 2020 -- DeHon

27

Delay in Graphs

- **Observe:** There are multiple paths from inputs to outputs
- Need to complete all of them to produce outputs
- Limited by longest path
- **Critical path:** longest path in the graph

Penn ESE532 Spring 2020 -- DeHon

28

Computation as Graph

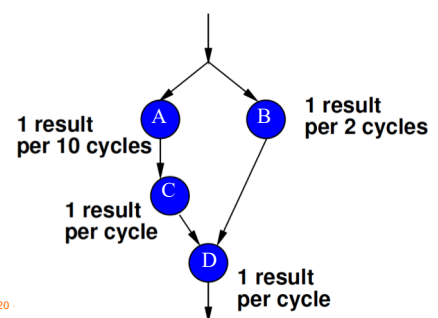

- Latency multiply = 1
- Latency add = 1/3
- Critical Path?

Penn ESE532 Spring 2020 -- DeHon

29

Bottleneck

- Where is the bottleneck?

Penn ESE532 Spring 2020 -- DeHon

Time and Space

(Part 3)

Space

- “Space” is an abstract term for physical resources
 - On VLSI chip: Area – mm² of silicon
 - On our FPGA: # of LUTs used
 - More abstractly: # of Adders, multipliers
 - Laundry example
 - \$\$ to spend on laundry equipment
 - Physical space (sq. ft) in laundry room

Space-Time

- In general, we can spend resources to reduce time
 - Increase throughput

Three wash stain removal case

Space Time

- Computation
 - $A=x0+x1$
 - $B=x2+x3$
 - $C=A+B$
- Adder takes one cycle
 - Latency on one adder?
 - Latency on 3 adders?

Computation as Graph

- Latency multiply = 1
- Space multiply = 3
- Latency add = 1
- Space add = 1
- Latency and Space – 3 mul, 2 add

Schedule 3 mul, 2 add

Cycle	Mul	Mul	Mul	Add	Add
0	A*B	C*D	E*F		
1				A*B+C*D	E*F+G
2				(A*B+C*D)D	+(E*F+G)

Computation as Graph

- Latency multiply = 1
- Space multiply = 3
- Latency add = 1
- Space add = 1
- Latency and Space – 2 mul, 1 add

Penn ESE532 Spring 2020 -- DeHon 37

Schedule 2 mul, 1 add

Cycle	Mul	Mul	Add
0	A*B	C*D	
1	E*F		(A*B+C*D)
2			E*F+G
3			(A*B+C*D)+(E*F+G)

Penn ESE532 Spring 2020 -- DeHon 38

Computation as Graph

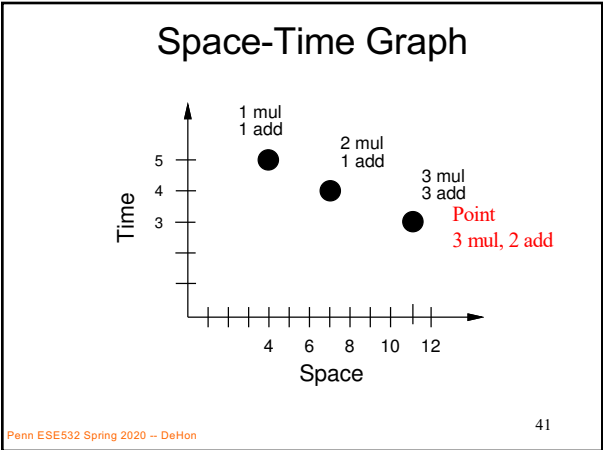

- Latency multiply = 1
- Space multiply = 3
- Latency add = 1
- Space add = 1
- Latency and Space – 1 mul, 1 add

Penn ESE532 Spring 2020 -- DeHon 39

Schedule 1 mul, 1 add

Cycle	Mul	Add
0	A*B	
1	C*D	
2	E*F	A*B+C*D
3		E*F+G
4		(A*B+C*D)+(E*F+G)

Penn ESE532 Spring 2020 -- DeHon 40

Two Bounds

Part 4: Limits
(still in Time and Space)

Penn ESE532 Spring 2020 -- DeHon 42

Problem

- Coming up with an exact time count can be hard (human/computer time consuming)
 - Technically a hard problem
 - NP-Complete: no known non-exponential solution
- Requires reasoning about structure of graph
- Would be nice to have a quick (easy) answer on what is feasible
 - ...and what is not feasible → impossible.

Penn ESE532 Spring 2020 -- DeHon

43

Bounds

- Establish the feasible range
 - Must be larger than LB
 - Must be smaller than UB
 - Solution will be between LB and UB
 - $LB \leq ActualTime \leq UB$
- Bounds in sports
 - Ball landing in-bounds or out-of bounds

Penn ESE532 Spring 2020 -- DeHon

44

Bounds

- Quick **lower** bounds (LB) can estimate
 - $LB \leq ActualTime$
- Two:
 - CP: Critical Path
 - Sometimes call it “Latency Bound”
 - RB: Resource Capacity Bound
 - Sometimes call it “Throughput Bound” or “Compute Bound”

Penn ESE532 Spring 2020 -- DeHon

45

Critical Path Lower Bound

- Critical path assuming infinite resources
- Certainly cannot finish x any faster than that
- $CP \leq ActualTime$
- Ignores resource limits

Penn ESE532 Spring 2020 -- DeHon

46

Resource Capacity Lower Bound

- Sum up all capacity required per resource: $TotalOps = \sum Ops$
 - E.g. number of multiplications, additions, memory lookups
- Divide by total resource (for type)
 - E.g., number of multipliers, adders, memory ports
 - $RB = \lceil TotalOps / Operators \rceil \leq ActualTime$
- Lower bound on compute
 - (best can do is pack all use densely)
 - Ignores data dependency constraints

Penn ESE532 Spring 2020 -- DeHon

47

Multiple Resource Types

- $RB = \text{Max}(\lceil TotalOps_1 / Operators_1 \rceil, \lceil TotalOps_2 / Operators_2 \rceil, \dots) \leq ActualTime$
- Combine Critical Path Lower Bound $\text{Max}(CP, \lceil TotalOps_1 / Operators_1 \rceil, \lceil TotalOps_2 / Operators_2 \rceil, \dots) \leq ActualTime$

Penn ESE532 Spring 2020 -- DeHon

48

For Single Resource Type

- (and no communication time...)
- Can use to get upper bound:
- $ActualTime \leq CP + RB$
- Together:
- $Max(CP, RB) \leq ActualTime \leq CP + RB$

Washer-Dryer Bounds

- Task: wash & dry 30 shirts
- Washer: 10 shirts/30 min.
- Dryer: 10 shirts/60 min.
- 2 Washers, 2 Dryers
- W-->D CP=90 minutes

Washer-Dryer Bounds

- Task: wash & dry 30 shirts CP=90 min
- Washer: 10 shirts/30 min.
- Dryer: 10 shirts/60 min.
- 2 Washers, 2 Dryers
- Washer Bound:
 - $WB = \lceil 30 \text{ shirts} / 2 \text{ washers} \rceil \times 10 \text{ shirts/washer} \times 30 \text{ min} = 60 \text{ min}$
- Dryer
 - $DB = \lceil 30 \text{ shirts} / 2 \text{ dryers} \rceil \times 10 \text{ shirts/dryer} \times 60 \text{ min} = 120 \text{ minutes}$

Washer-Dryer Bounds

- Task: wash & dry 30 shirts CP=90 min
- Washer: 10 shirts/30 min.
- Dryer: 10 shirts/60 min.
- 2 Washers, 2 Dryers RB=120 min
- $Max(90, 60, 120) = 120 \leq TaskTime$
- TaskTime: 150
 - 0 start 2 washes
 - 30 start 2 dryers; start 1 wash
 - 90 finish 2 dryers; start last dryer load
 - 150 finish last dryer load

Example

Example

Example

Cycle	Resource 1	Resource 2
0	A	B
1	C	D
2	E	F
3	G	

Resource Bound (2 resources)?

Penn ESE532 Spring 2020 -- DeHon

55

Example

Resource Bound (4 resources)?

Penn ESE532 Spring 2020 -- DeHon

56

Example

Cycle	R1	R2	R3	R4
0	A	B	C	D
1	E	F	G	

Legal Schedule?

Penn ESE532 Spring 2020 -- DeHon

57

Resource Capacity Lower Bound

- Sum up all capacity required per resource: $TotalOps = \sum Ops$
 - E.g. number of multiplications, additions, memory lookups
- Divide by total resource (for type)
 - E.g., number of multipliers, adders, memory ports
 - $RB = \lceil TotalOps / Operators \rceil \leq ActualTime$
- Lower bound on compute
 - (best can do is pack all use densely)
 - **Ignores data dependency constraints**

Penn ESE532 Spring 2020 -- DeHon

58

Example

Critical Path 3

Resource Bound (2 resources) 7/2=4

Resource Bound (4 resources) 7/4=2

Either one (CP,RB) can be limit. Check both.
In general, independent → relation depends on task.

Penn ESE532 Spring 2020 -- DeHon

59

What are the telling us

- If $CP < RB$
 - Adding resources (space) may be effective at reducing latency
- If $RB < CP$
 - Adding resources (space) will not reduce latency

Penn ESE532 Spring 2020 -- DeHon

60

90/10 Rule (of Thumb)

- Observation that code is not used uniformly
- 90% of the time is spent in 10% of the code
- Knuth: 50% of the time in 2% of the code
- Implications
 - There will typically be a bottleneck
 - We don't need to optimize everything
 - We don't need to uniformly replicate space to achieve speedup
 - Not everything needs to be accelerated

Penn ESE532 Spring 2020 -- DeHon

61

Big Ideas

- Identify the Bottleneck
 - May be in compute, I/O, memory ,data movement
- Focus and reduce/remove bottleneck
 - More efficient use of resources
 - More resources

Penn ESE532 Spring 2020 -- DeHon

62

Admin

- Reading for Day 3 on web
- HW1 due Friday
- HW2 out
 - Partner assignment (will add tonight)
(see canvas)
- Remember feedback
- Remaining Questions?

Penn ESE532 Spring 2020 -- DeHon

63
