

nn ESE532 Spring 2017 – DeHon

nn ESE532 Spring 2017 - DeHon

6

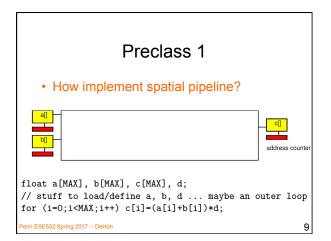

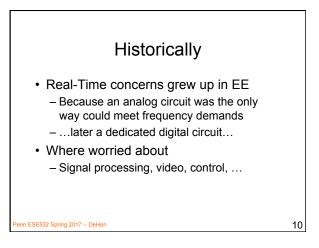

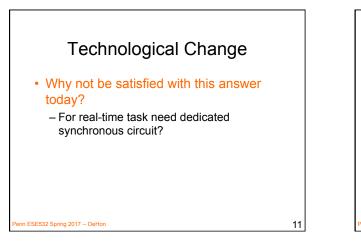

- "model" for real-time task
- Run at fixed clock rate
- Take input every cycle
- Produce output every cycle
- Complete computation between input and output
- Designed to run at fixed-frequency
 - Critical path meets frequency requirement

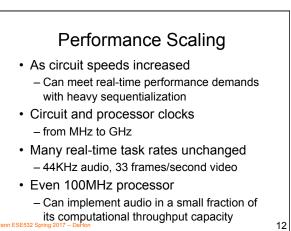

8

nn ESE532 Spring 2017 – DeHon

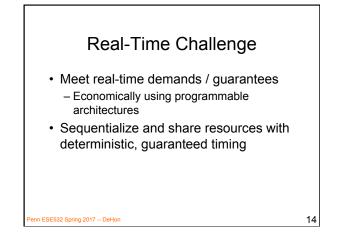

HW/SW Co-Design

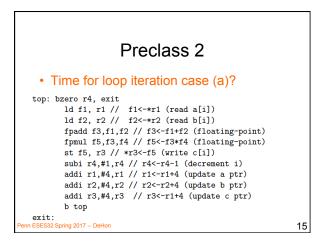

13

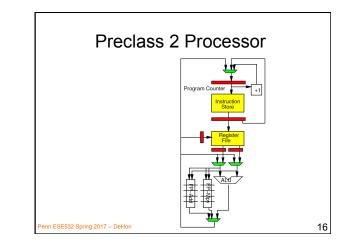

- Computer Engineers know can implement anything as hardware or software
- Want freedom to move between hardware and software to meet requirements

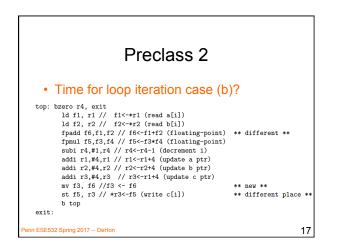

– Performance, costs, energy

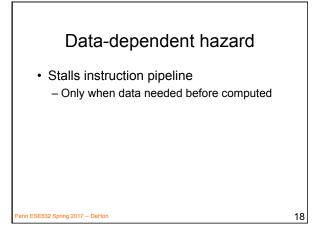

Penn ESE532 Spring 2017 -- DeHon

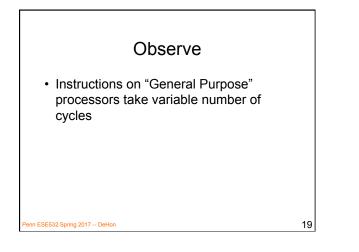

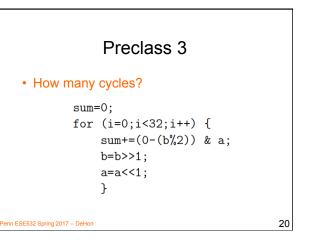

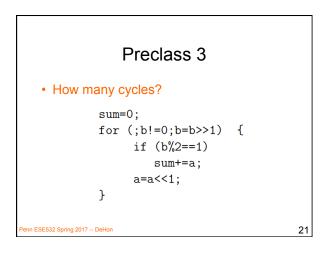

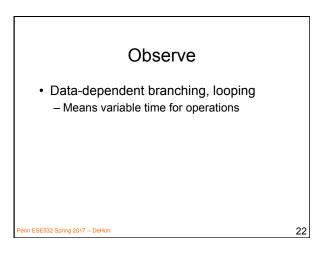

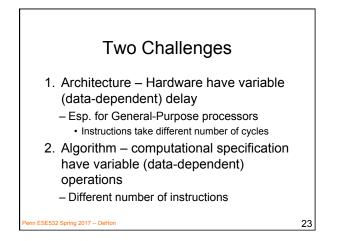

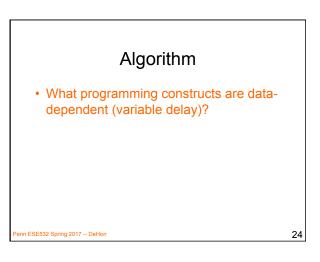

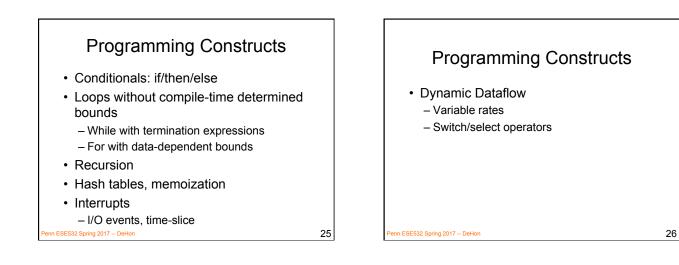

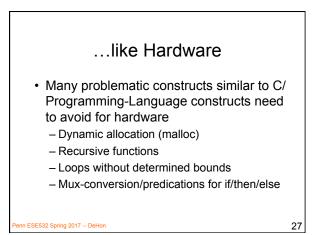

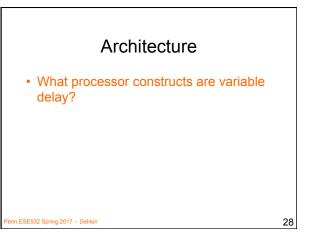

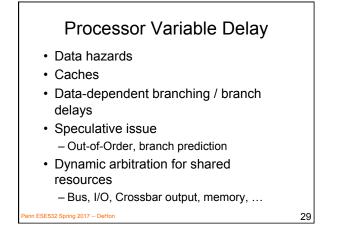

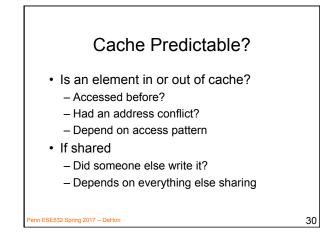

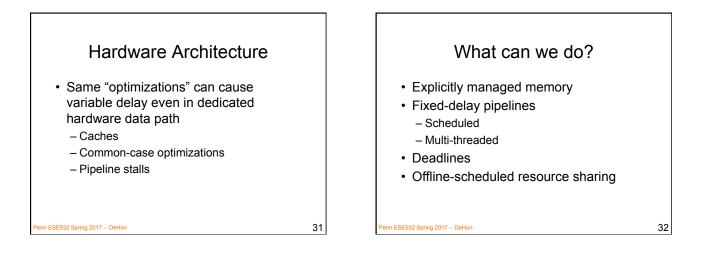

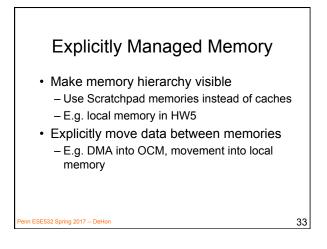

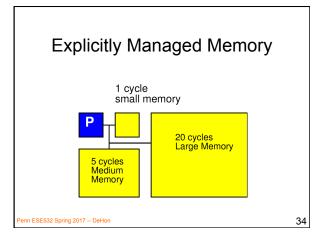

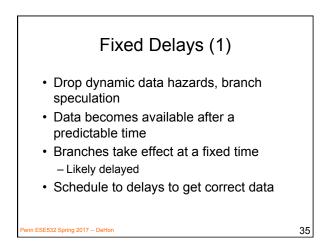

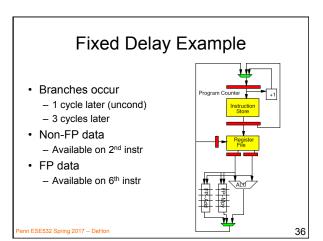

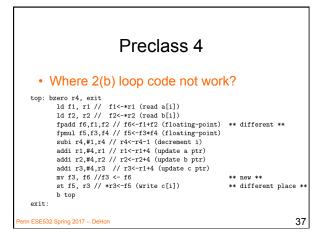

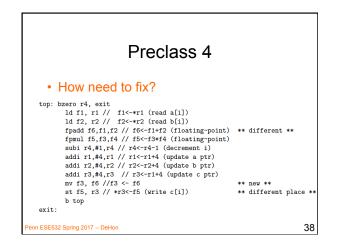

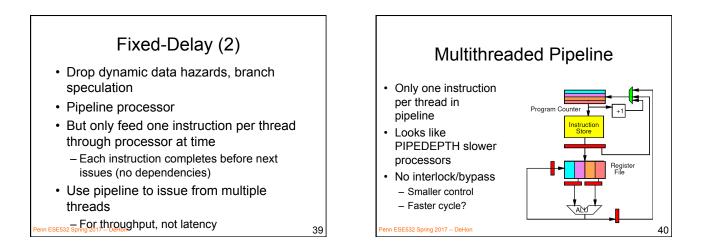

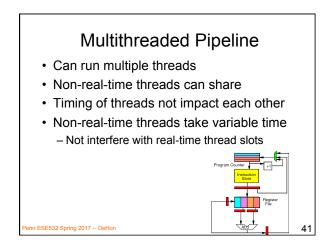

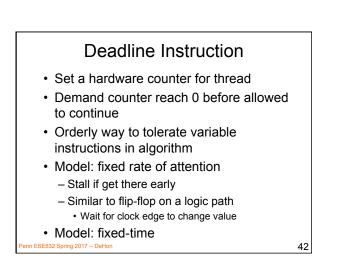

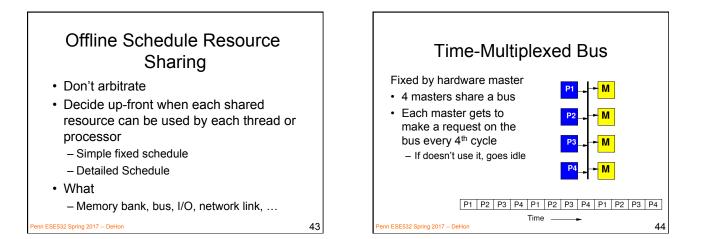

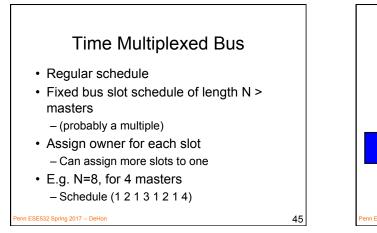

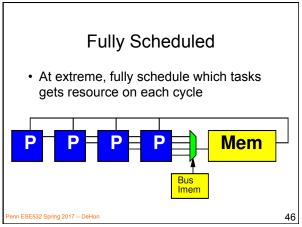

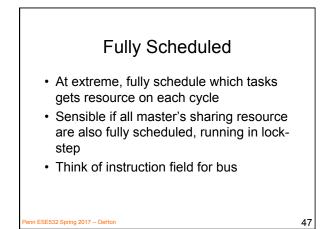

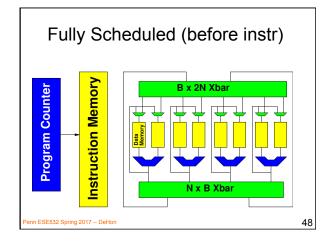

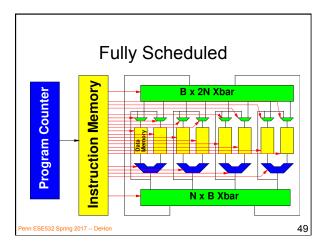

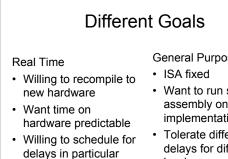

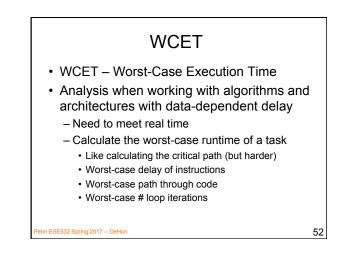

General Purpose

- · Want to run same assembly on different implementations
- · Tolerate different delays for different hardware
- · Run faster on newer, larger implementations

51

Big Ideas:

- · Real-Time applications demand different discipline from best-effort tasks
- · Look more like synchronous circuits and hardware discipline
- Can sequentialize like processor
 - But must avoid/rethink typical processor common-case optimizations
 - Offline calculate static schedule for computation and sharing
