

ESE532: System-on-a-Chip Architecture

Day 12: February 27, 2017
Real Time Scheduling

Penn ESE532 Spring 2017 -- DeHon

Today

Real Time

- Synchronous Reactive Model
- Interrupts
 - Polling alternative
 - Timer?
- Resource Scheduling Graphs

Penn ESE532 Spring 2017 -- DeHon

2

Message

- Scheduling is key to real time
 - Analysis
 - Guarantees

Penn ESE532 Spring 2017 -- DeHon

3

Synchronous Circuit Model

- A simple synchronous circuit is a good “model” for real-time task
 - Run at fixed clock rate
 - Take input every cycle
 - Produce output every cycle
 - Complete computation between input and output
 - Designed to run at fixed-frequency
 - Critical path meets frequency requirement

Penn ESE532 Spring 2017 -- DeHon

4

Synchronous Reactive Model

- Discipline for Real-time tasks
- Embodies the “synchronous circuit model”

Penn ESE532 Spring 2017 -- DeHon

5

Synchronous Reactive

- There is a rate for interaction with external world (like the clock)
- Computation scheduled around these clock ticks (or time-slices)
 - Continuously running threads
 - Each thread performs action per tick
- Inputs and outputs processed at this rate
- Computation can “react” to events
 - Reactions finite and processed before next tick

Penn ESE532 Spring 2017 -- DeHon

6

Thread Form

```
while (1) { tick(); }
```

- tick() -- yields after doing its work

Penn ESE532 Spring 2017 -- DeHon

7

Thread Model

Penn ESE532 Spring 2017 -- DeHon

8

Tick Rate

- Driven by application – demands of external control
 - Control loop 100 Hz
 - Robot, airplane, car, manufacturing plant
 - Video at 33 fps
 - Game with 20ms response
 - Router with 1ms packet latency

Penn ESE532 Spring 2017 -- DeHon

9

Tick Rate

- Multiple rates
 - May need master tick least-common multiple
 - ...and lower freq. events scheduled less frequently
 - E.g. 100Hz control loop at 33Hz video
 - Master at 10ms
 - Schedule video over 3 10ms time-slots

Penn ESE532 Spring 2017 -- DeHon

10

Synchronous Reactive

- Ideal model
 - Per tick reaction (task processing) instantaneous
- Separate function from compute time
- Separate function from technology
 - Feature size, processor mapped to
- Like synchronous circuit
 - If logic correct, works when run clock slow enough
 - Works functionally when change technology
 - Then focus on reducing critical path

Penn ESE532 Spring 2017 -- DeHon

11

Synchronous Reactive Timing

- Once functional,
 - need to guarantee all tasks (in all states) can complete in tick time-slot
 - On particular target architecture
- Identify WCET
 - Like critical path in FSM circuit
 - Time of task on processor target

Penn ESE532 Spring 2017 -- DeHon

12

Preclass 1

- Time available to process objects?

```

tick() {
  for(i=0;i<MAX_OBJECTS;i++) {
    obj[i].inputs(); // see below
    obj[i].updatePositionState(); // 1,000 cycles
    obj[i].collide(); // 9,000 cycles
    obj[i].render(); // 1,000 cycles
  }
  updateScreen(); // takes 10 ms
}
    
```

Penn ESE532 Spring 2017 -- DeHon

13

Preclass 1

- Worst-case object processing time?

```

tick() {
  for(i=0;i<MAX_OBJECTS;i++) {
    obj[i].inputs(); // see below
    obj[i].updatePositionState(); // 1,000 cycles
    obj[i].collide(); // 9,000 cycles
    obj[i].render(); // 1,000 cycles
  }
  updateScreen(); // takes 10 ms
}

// for object class
inputs() {
  int move=getMoveInput(); // 10
  int fire=getFireInput(); // 10
  switch (move){
    case LEFT: moveLeft(); break; // 10
    case RIGHT: moveLeft(); break; // 10
    case FORWARD: thrustIncrease(); break; // 1,000
    case BACK: thrustDecrease(); break; // 1,000
    default:
  }
  if (fire) processFire(); // 20,000
}
    
```

Penn ESE532 Spring 2017 -- DeHon

Preclass 1

- Maximum number of objects on single GHz processor?

Penn ESE532 Spring 2017 -- DeHon

15

Synchronous Reactive Timing

- Once functional,
 - need to guarantee all tasks (in all states) can complete in tick time-slot
 - On particular target architecture
- Identify WCET
 - Like critical path in FSM circuit
 - Time of task on processor target
- Schedule onto platform
 - Threads onto processor(s)

Penn ESE532 Spring 2017 -- DeHon

16

Threads Mapped to Processor

Penn ESE532 Spring 2017 -- DeHon

17

Platforms

- Platform 1: fast processor
- Platform 2: many slow processors

Penn ESE532 Spring 2017 -- DeHon

18

Synchronous Reactive Model

- Discipline for Real-time tasks
- Embodies the “synchronous circuit model”
 - Master clock rate
 - Computation decomposed per clock
 - Functionality assuming instantaneous compute
 - On platform, guarantee runs fast enough to complete critical path at “clock” rate

Midterm

Midterm

- Analysis
 - Bottleneck
 - Amdhal's Law
 - Computational requirements
 - Resource Bounds
 - Critical Path
 - Latency/throughput
- From Code
- Forms of Parallelism
- SIMD, hardware pipeline
- Map/schedule task graph to (multiple) target substrates
- Memory assignment and movement
- Area-time?

Interrupts

Interrupt

- External event that redirects processor flow of control
- Typically forces a thread switch
- Common for I/O, Timers
 - Indicate a need for attention

Interrupts: Good

- Allow processor to run some other work
- Infrequent, irregular task service with low response service latency
 - Low latency, low throughput

Interrupts: Bad

- Time predictability
 - Real-time for computing tasks interrupted
- Processor usage
 - Costs time to switch contexts
- Concurrency management
 - Must deal with tasks executing non-atomically
 - Interleave of interrupted service tasks
 - Perhaps interleave of any task

Penn ESE532 Spring 2017 -- DeHon

25

Polling Discipline

- Every I/O task is a thread
- Budget time and rate it needs to run
 - E.g. 10,000 cycles every 5ms
 - Likely tied to
 - Buffer sizes
 - Response latency
- Schedule I/O threads as real-time tasks
 - Some can be DMA channels

Penn ESE532 Spring 2017 -- DeHon

26

IO Thread

```
while (1) { process_input(); }
```

- Like tick() -- yields after doing its work

Penn ESE532 Spring 2017 -- DeHon

27

Preclass 2

- Input at 100KB/s
- 30ms time-slot window
- Size of buffer?
- 100 cycles/byte, GHz processor – runtime of service routine?
 - Fraction of processor capacity?

Penn ESE532 Spring 2017 -- DeHon

28

Scheduling I/O Tasks

Penn ESE532 Spring 2017 -- DeHon

29

Timer Interrupts

- Bounded-time tasks
 - E.g. reactive tasks in real-time
 - Task has guarantee to release processor within time window
 - Not need timer interrupts to regain control from task
 - (Maybe use deadline operations for timer)

Penn ESE532 Spring 2017 -- DeHon

30

Timer Interrupts

- Best effort tasks
 - Have no guarantee to finish in bounded time
 - Timer interrupts necessary
 - to allow other threads to run
 - fairness
 - to switch to real-time service tasks
- Need timer interrupts if need to share processor with real-time threads
 - Easier to segregate real-time and best-effort threads onto different processors

Penn ESE532 Spring 2017 -- DeHon

31

Greedy Strategy

- Schedule real-time tasks
 - Scheduled based on worst-case, so may not use all time allocated
- Run best-effort tasks at end of time-slice after complete real-time tasks
 - Timer-interrupt to recover processor in time for start of next scheduling time slot
- (adds complexity)

Penn ESE532 Spring 2017 -- DeHon

32

Resource Scheduling Graphs

Penn ESE532 Spring 2017 -- DeHon

33

Scheduling

- Useful to think about scheduling a processor by task usage
- Useful to budget and co-schedule required resources
 - Bus
 - Memory port
 - DMA channel

Penn ESE532 Spring 2017 -- DeHon

34

Simple Task Model

- Task requires
 - Data to be transferred
 - Local storage state
 - Computational cycles
 - (Result data to be transferred)
- Uses resources
 - Bus/channel to transfer data
 - (in and out)
 - Space in memory on accelerator
 - Cycles on accelerator

Penn ESE532 Spring 2017 -- DeHon

35

One Task

Penn ESE532 Spring 2017 -- DeHon

36

Several Tasks

Penn ESE532 Spring 2017 -- DeHon

37

Resource Schedule Graph

- Extend as necessary to capture potentially limiting resources and usage
 - Regions in memories
 - Memory ports
 - I/O channels

Penn ESE532 Spring 2017 -- DeHon

38

Extended Details

Penn ESE532 Spring 2017 -- DeHon

39

Several Tasks

Penn ESE532 Spring 2017 -- DeHon

40

Approach

- Ideal/initial – look at processing requirements
 - Resource bound on processing
- Look for bottlenecks / limits with Resource Bounds independently
 - Add buses, memories, etc.
- Plan/schedule with Resource Schedule Graph

Penn ESE532 Spring 2017 -- DeHon

41

Preclass 3a

- Resource Bound
 - Data movement over bus?
 - Compute on 2 processors?
 - Compute on 2 processors when processor must wait while local memory is written?

Task	Data Needed (Bytes)	Compute Cycles	(Data+Compute work)
A	1600	1600	
B	200	600	
C	800	3200	
D	200	600	
E	400	400	

Penn ESE532 Spring 2017 -- DeHon

42

Preclass 3b Schedule

- Processor wait for data load

	200 cycle intervals																																		
	01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32			
Processor 1																																			
Processor 2																																			
Bus																																			

Penn ESE532 Spring 2017 -- DeHon

43

Double Buffering

- Common trick to overlap compute and communication
- Reserve two buffers input (output)
- Alternate buffer use for input
- Producer fills one buffer while consumer working from the other
- Swap between tasks
- Trade memory for concurrency

Penn ESE532 Spring 2017 -- DeHon

44

Preclass 3c Schedule

- Double Buffer

	200 cycle intervals																																		
	01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32			
Processor 1																																			
Processor 2																																			
Bus																																			

Penn ESE532 Spring 2017 -- DeHon

45

Resource Schedule Graphs

- Useful to plan/visualize resource sharing and bottlenecks in SoC
- Supports scheduling
- Necessary for real-time scheduling

Penn ESE532 Spring 2017 -- DeHon

46

Big Ideas:

- Scheduling is key to real time
 - Analysis, Guarantees
- Synchronous reactive
 - Scheduling worst-case tasks “reactions” into master time-slice matches rate
- Schedule I/O with polling threads
 - Avoid interrupts
- Schedule dependent resources
 - Buses, memory ports, memory regions...

Penn ESE532 Spring 2017 -- DeHon

47

Admin

- Exam Wednesday
- HW6 due Friday
- <Enjoy Spring Break>

Penn ESE532 Spring 2017 -- DeHon
