ESE532:
System-on-a-Chip Architecture

Day 4: January 25, 2017
Data-Level Parallelism

Penn

Today

Data-level Parallelism
- For Parallel Decomposition
- Architectures
- Concepts
- NEON

Message

- Data Parallelism easy basis for decomposition
- Data Parallel architectures can be compact – pack more computations onto a die

---

Preclass 1

- 300 news articles
- Count total occurrences of a string
- How can we exploit data-level parallelism on task?
- How much parallelism can we exploit?

Parallel Decomposition

Data Parallel

- Data-level parallelism can serve as an organizing principle for parallel task decomposition

- Run computation on independent data in parallel

Exploit

- Can exploit with
  - Threads
  - Instruction-level Parallelism
 - Fine-grained Data-Level Parallelism

Thread Exploit DP

- How exploit threads for data-parallel text search?

SPMD

Single Program Multiple Data
- Only need to write code once
- Get to use many times

ILP Exploit DP

- How exploit ILP for DP?

Pipeline Exploit

- How exploit hardware pipeline for text search?

Common Examples

- What are common examples of DLP?
  - Signal Processing
  - Simulation
  - Numerical Linear Algebra
  - Graphics
  - Image Processing
  - Optimization
  - Other?

## Hardware Architectures

13

Idea

- If we're going to perform the same operations on different data, exploit that to reduce area, energy

- Reduced area means can have more computation on a fixed-size die.

14

SIMD

- Single Instruction Multiple Data

Shared Instruction

15

W-bit ALU as SIMD

- Familiar idea
- A W-bit ALU (W=8, 16, 32, 64, …) is SIMD
- Each bit of ALU works on separate bits
  – Performing the same operation on it
    - Trivial to see bitwise AND, OR, XOR
    - Also true for ADD (each bit performing Full Adder)
- Share one instruction across all ALU bits
16

ALU Bit Slice

-

17

Register File

- Small Memory
- Usually with multiple ports
  – Ability to perform multiple reads and writes simultaneously
- Small
  – To make it fast (small memories fast)
  – Multiple ports are expensive

18

3

Preclass 2

- Area W=16?
- Area W=128?

- Number in 10^8
  - W=16
  - W=128
- Perfect Pack Ratio?

128 x 32 Instruction Memory · · · **ALU bit slice**

32 entry Register File

W–bit wide datapath

Preclass 2

- W for single datapath in 10^8?
- Perfect 16b pack ratio?

- Compare W=128 perfect pack ratio?

128 x 32 Instruction Memory · · · **ALU bit slice**
32 entry Register File

W–bit wide datapath

ALU vs. SIMD ?

- What's different between
  - 128b wide ALU
  - SIMD datapath supporting eight 16b ALU operations

Segmented Datapath

- Relatively easy (few additional gates) to convert a wide datapath into one supporting a set of smaller operations
  - Just need to squash the carry at points

Bit 7   carry   Bit 2   Bit 1   Bit 0

Instruction

Segment

Segmented Datapath

- Relatively easy (few additional gates) to convert a wide datapath into one supporting a set of smaller operations
  - Just need to squash the carry at points
- But need to keep instructions (description) small
  - So typically have limited, homogeneous widths supported

Segmented 128b Datapath

- 1x128b, 2x64b, 4x32b, 8x16b

squash carry

Shared Instruction   16b ALU blocks
Segment 16
Segment 32
Segment 64

Terminology: Vector Lane

- Each of the separate segments called a **Vector Lane**
- For 16b data, this provides 8 vector lanes

squash carry

Shared Instruction
Segment 16
Segment 32
Segment 64

16b ALU blocks

25

Opportunity

- Don't need 64b variables for lots of things
- Natural data sizes?
  - Audio samples?
  - Input from A/D?
  - Video Pixels?
  - X, Y coordinates for 4K x 4K image?

26

Vector Computation

- Easy to map to SIMD flow if can express computation as operation on vectors
 - Vector Add
  - Vector Multiply
  - Dot Product

27

Concepts

28

Vector Register File

- Need to be able to feed the SIMD compute units
  - Not be bottlenecked on data movement to the SIMD ALU
- Wide RF to supply
- With wide path to memory

squash carry

Shared Instruction
Segment 16
Segment 32
Segment 64

16b ALU blocks

Point-wise Vector Operations

- Easy – just like wide-word operations (now with segmentation)

squash carry

Shared Instruction
Segment 16
Segment 32
Segment 64

16b ALU blocks

30

5

Point-wise Vector Operations

- …but alignment matters.
- If not aligned, need to perform data movement operations to get aligned

Vector Length

- May not match physical hardware length
- What happens when
  - Vector length > hardware SIMD operators?
  - Vector length < hardware SIMD operators?
  - Vector length % hdw operators !=0
    - E.g. vector length 20, for 8 hdw operators

Skipping Elements?

- How does this work with datapath?
- for (i=0;i<64;i=i+2)
  - c[i]=a[i]+b[i]

Stride

- Stride: the distance between vector elements used
- for (i=0;i<64;i=i+2)
  - c[i]=a[i]+b[i]

- Accessing data with stride=2

Load/Store

- Strided load/stores
  - Some architectures will provide strided memory access that compact when read into register file
- Scatter/gather
  - Some architectures will provide memory operations to grab data from different places to construct a dense vector

Conditionals?

- What happens if want to do something different?
- For (i=0;i<8;i++)
  - if (a[i]<b[i])
    - d[i]=a[i]+c[i]
  - else
    - d[i]=b[i]+c[i]

Conditionals

- Only have one Program Counter
  - Cannot implement conditional via branching

37

Conditionals

- Only have one instruction
  - Cannot perform separate operations on each ALU in datapath

38

Conditionals

- Only have one Program Counter
  - Cannot implement conditional via branching
- Only have one instruction
  - Cannot perform separate operations on each ALU in datapath
- Must perform an invariant operation sequence
39

Invariant Operation

- If ($a[i] < b[i]$)
  - then $d[i] = a[i] + c[i]$
  - else $d[i] = b[i] + c[i]$

- What's in each register as go through sequence?

1. $T1[i] = a[i] < b[i]$
2. $T2[i] = -T1[i]$
3. $T3[i] = \sim(T2[i])$
4. $T2[i] = a[i]$ & $T2[i]$
5. $T3[i] = b[i]$ & $T3[i]$
6. $d[i] = c[i] + T2[i]$
7. $d[i] = c[i] + T3[i]$

40

If→Mux Conversion

- Can always transform into a data independent sequence
- Often convenient to think of IF's as Multiplexers
- If (cond)
     o=a
- else
     o=b

41

Predicated Operation

- Many architectures will provide a predicated operation
- Only perform operation when predicate matches instruction

- $p[i] = a[i] < b[i]$
- $p[i]$: $d[i] = c[i] + a[i]$
- $\sim p[i]$: $d[i] = c[i] + b[i]$

42

7

Predicated Operation

- What does this do to instructions must be issued?
- What does this do to efficiency?
  - Useful operations performed per cycle

- p[i]=a[i]<b[i]
- p[i]:   d[i]=c[i] + a[i]
- ~p[i]: d[i]=c[i] + b[i]

Nested Conditionals

- What happens with nested conditionals?

Dot Product

- What happens when need a dot product?
- res=0;
- for (i=0;i<N;i++)
  - res+=a[i]*b[i]

Reduction

- Common operations where want to perform a combining operation to reduce a vector to a scalar
  - Sum values in vector
  - AND, OR
- Reduce Operation
Reduce Tree

- Efficiently handled with reduce tree

Reduce in Pipeline

- Comes almost for free in pipeline

a[2] b[2]
a[1] b[1]
a[0] b[0]

3 stage multiply

res

Vector Reduce Instruction

- Usually include support for vector reduce operation
  - Doesn't need to add much to delay
  - Maybe even faster than performing larger operation
    - 8 16x16 multiplies with sum reduce less complex than one 128x128 multiply
   - …can exploit datapath of larger operation

49

Dot Product Revisited

- With 3 cycle pipelined multiply
- What happens if try to implement dot product as:
  - MPY R0, R4, R14
  - ADD R14, R15, R15
  - MPY R1, R5, R14
  - ADD R14, R15, R15
  - …

- for (i=0;i<N;i++)
  - res+=a[i]*b[i]
- a in R0—R4
- b in R4—R7

50

Dot Product Revisited

- How should order (reformulate) instructions exploiting data-level parallelism?

- for (i=0;i<N;i++)
  - res+=a[i]*b[i]
- a in R0—R4
- b in R4—R7

51

Pipelined Vector Units

- Will get both pipelining and parallel vector lanes
- Exploit data-level parallelism for both

52

Neon

53

9

Neon Vector

- 128b wide register file, 16 registers
- Support
  - 2x64b
  - 4x32b (also Single-Precision Float)
  - 8x16b
  - 16x8b

55

Sample Instructions

- VADD – basic vector
- VCEQ – compare equal
  - Sets to all 0s or 1s, useful for masking
- VMIN – avoid using if's
- VMLA – accumulating multiply
- VPADAL – maybe useful for reduce
- VEXT – for "shifting" vector alignment
- VLDn – deinterleaving load

56

Neon Notes

- Didn't see
  - Vector-wide reduce operation
  - Conditionals within vector lanes
- Do need to think about operations being pipelined within lanes

57

Big Ideas

- Data Parallelism easy basis for decomposition
- Data Parallel architectures can be compact – pack more computations onto a chip
  - SIMD, Pipelined
  - Benefit by sharing (instructions)
  - Performance can be brittle
    - Drop from peak as mismatch
