

ESE535: Electronic Design Automation

Day 14: March 16, 2009
Multi-level Synthesis

Penn ESE353 Spring 2009 -- DeHon

Today

- Multilevel Synthesis/Optimization
 - Why
 - Transforms -- defined
 - Division/extraction
 - How we support transforms

2

Multi-level

- General circuit netlist
- May have
 - sums within products
 - products within sum
 - arbitrarily deep
- $y=((a(b+c)+e)fg+h)i$

3

Why multi-level?

- $ab(c+d+e)(f+g)$
- $abcf+abdf+abef+abcg+abdg+abeg$
- 6 product terms
- vs. 3 gates: and4,or3,or2
- Aside from Pterm sharing between outputs,
 - two level cannot share sub-expressions

4

Why Multilevel

- $a \oplus b$
 - $a/b+/ab$
- $a \oplus b \oplus c$
 - $a/bc+/abc+/a/b/c+ab/c$
- $a \oplus b \oplus c \oplus d$
 - $a/bcd+/abcd+/a/b/cd+ab/cd+/ab/c/d+a/b/c/d+abc/d+/a/bc/d$

5

Why Multilevel

- Compare
- $a \oplus b$
 - $x1=a/b+/ab$
 - $a \oplus b \oplus c$
 - $x2=x1/c+/x1*c$
 - $a \oplus b \oplus c \oplus d$
 - $x3=x2/d+/x2*d$

6

Penn ESE353 Spring 2009 -- DeHon

Why Multilevel

- $a \oplus b$
 - $x_1 = a/b + ab$
- $a \oplus b \oplus c$
 - $x_2 = x_1/c + x_1 \cdot c$
- $a \oplus b \oplus c \oplus d$
 - $x_3 = x_2/d + x_2 \cdot d$
- Multi-level
 - exploit common sub-expressions
 - linear complexity
- Two-level
 - exponential complexity

7

Penn ESE353 Spring 2009 -- DeHon

Goal

- Find the structure
- Exploit to minimize gates
 - Total (area)
 - In path (delay)

8

Penn ESE353 Spring 2009 -- DeHon

Multi-level Transformations

- Decomposition
- Extraction
- Factoring
- Substitution
- Collapsing
- [copy these to board so stay up as we move forward]

9

Penn ESE353 Spring 2009 -- DeHon

Decomposition

- $F = abc + abd + /a/c/d + /b/c/d$
- $F = XY + /X/Y$
- $X = ab$
- $Y = c + d$

10

Penn ESE353 Spring 2009 -- DeHon

Decomposition

- $F = abc + abd + /a/c/d + /b/c/d$
 - 4 3-input + 1 4-input
- $F = XY + /X/Y$
- $X = ab$
- $Y = c + d$
 - 5 2-input gates
- Note: use X and /X, use at multiple places

11

Penn ESE353 Spring 2009 -- DeHon

Extraction

- $F = (a+b)cd + e$
- $G = (a+b)/e$
- $H = cde$
- $F = XY + e$
- $G = X/e$
- $H = Ye$
- $X = a + b$
- $Y = cd$

12

Penn ESE353 Spring 2009 -- DeHon

Extraction

- $F = (a+b)cd + e$
- $G = (a+b)/e$
- $H = cde$
- 2-input: 4
- 3-input: 2
- $F = XY + e$
- $G = X/e$
- $H = Ye$
- $X = a+b$
- $Y = cd$
- 2-input: 6

Common sub-expressions over **multiple output**

13

Penn ESE353 Spring 2009 -- DeHon

Factoring

- $F = ac + ad + bc + bd + e$
- $F = (a+b)(c+d) + e$

14

Penn ESE353 Spring 2009 -- DeHon

Factoring

- $F = ac + ad + bc + bd + e$
 - 4 2-input, 1 5-input
 - 9 literals
- $F = (a+b)(c+d) + e$
 - 4 2-input
 - 5 literals

15

Penn ESE353 Spring 2009 -- DeHon

Substitution

- $G = a + b$
- $F = a + bc$
- Substitute G into F
- $F = G(a+c)$
 - (verify) $F = (a+b)(a+c) = aa + ab + ac + bc = a + bc$
- useful if also have $H = a + c$? ($F = GH$)

16

Penn ESE353 Spring 2009 -- DeHon

Collapsing

- $F = Ga + /Gb$
- $G = c + d$
- $F = ac + ad + b/c/d$
- opposite of substitution
 - sometimes want to collapse and refactor
 - especially for delay optimization

17

Penn ESE353 Spring 2009 -- DeHon

Moves

- These transforms define the “moves” we can make to modify our network.
- Goal is to apply, usually repeatedly, to minimize gates
 - ...then apply as necessary to accelerate design
- MIS/SIS
 - Applies to canonical 2-input gates
 - Then covers with target gate library
 - Coming up Day 18 (next Monday)

18

Penn ESE353 Spring 2009 -- DeHon

Division

Penn ESE353 Spring 2009 -- DeHon

19

Division

- **Given:** function (f) and divisor (p)
- **Find:** quotient and remainder
 $f = pq + r$

E.g.

$$f = abc + abd + ef, \quad p = ab \\ q = c + d, \quad r = ef$$

Penn ESE353 Spring 2009 -- DeHon

20

Algebraic Division

- Use basic rules of algebra, rather than full boolean properties
- Computationally simple
- Weaker than boolean division
- $f = a + bc \quad p = (a + b)$
- **Algebra:** not divisible
- **Boolean:** $q = (a + c), \quad r = 0$

Penn ESE353 Spring 2009 -- DeHon

21

Algebraic Division

- f and p are expressions (lists of cubes)
- $p = \{a_1, a_2, \dots\}$
- $h_i = \{c_j \mid a_i * c_j \in f\}$
- $f/p = h_1 \cap h_2 \cap h_3 \dots$

Penn ESE353 Spring 2009 -- DeHon

22

Algebraic Division Example (adv to alg.; work ex on board)

- $f = abc + abd + de$
- $p = ab + e$

Penn ESE353 Spring 2009 -- DeHon

23

Algebraic Division

- f and p are expressions (lists of cubes)
- $p = \{a_1, a_2, \dots\}$
- $h_i = \{c_j \mid a_i * c_j \in f\}$
- $f/p = h_1 \cap h_2 \cap h_3 \dots$

Penn ESE353 Spring 2009 -- DeHon

24

Algebraic Division Example

- $f=abc+abd+de, p=ab+e$
- $p=\{ab,e\}$
- $h1=\{c,d\}$
- $h2=\{d\}$
- $h1 \cap h2=\{d\}$
- $f/p=d$
- $r=f- p * (f/p)$
- $r=abc+abd+de-(ab+e)d$
- $r=abc$

Penn ESE353 Spring 2009 -- DeHon

25

Algebraic Division Time

- $O(|f||p|)$ as described
 - compare every cube pair
- Sort cubes first
 - $O((|f|+|p|)\log(|f|+|p|))$

Penn ESE353 Spring 2009 -- DeHon

26

Primary Divisor

- f/c such that c is a cube
- $f = abc+abde$
- $f/a=bc+bde$ is a primary divisor

Penn ESE353 Spring 2009 -- DeHon

27

Cube Free

- The only cube that divides p is 1
- $c+de$ is cube free
- $bc+bde$ is not cube free

Penn ESE353 Spring 2009 -- DeHon

28

Kernel

- Kernels of f are
 - cube free primary divisors of f
 - *Informally*: sums w/ cubes factored out
- $f=abc+abde$
- $f/ab = c+de$ is a kernel
- ab is **cokernel** of f to $(c+de)$
 - cokernels always cubes

Penn ESE353 Spring 2009 -- DeHon

29

Kernel Extraction

- Kernel1(j,g)
 - $R=g$
 - N max index in g
 - **for**($i=j+1$ to N)
 - if (l_i in 2 or more cubes)
 - c_i =largest cube divide g/l_i
 - if (**forall** $k \leq i, l_k \notin c_i$)
 - » $R=R \cup$
 $KERNEL1(i,g/(l_i \cap c_i))$
 - return(R)

Must be to
Generate
Non-trivial
kernel

Consider each literal for cofactor once
³⁰
 Penn ESE353 Spring 2009 -- DeHon
 (largest kernels will already have been found)

Kernel Extract Example (ex. on board; adv to return to alg.)

- $f = abcd + abce + abef$

Penn ESE353 Spring 2009 -- DeHon

31

Kernel Extraction

- Kernel1(j,g)
 - $R = g$
 - N max index in g
 - for($i=j+1$ to N)
 - if (I_i in 2 or more cubes)
 - c_f = largest cube divide g/I_i
 - if (forall $k \leq i, I_k \notin c_f$)
 » $R = R \cup$
 $\text{KERNEL1}(i, g/(I_i \cap c_f))$
 - return(R)

Consider each literal for cofactor once
 Penn ESE353 Spring 2009 -- DeHon (largest kernels will already have been found)

Must be to
Generate
Non-trivial
kernel

Kernel Extract Example (stay on prev. slide, ex. on board)

- $f = abcd + abce + abef$
- $c_f = ab$
- $f/c_f = cd + ce + ef$
- $R = \{cd + ce + ef\}$
- $N = 6$
- a,b not present
- $(cd + ce + ef)/c = e + d$
- largest cube 1
- Recurse $\rightarrow e + d$
- $R = \{cd + ce + ef, e + d, c + f\}$

33

Penn ESE353 Spring 2009 -- DeHon

Factoring

- Gfactor(f)
 - if (terms==1) return(f)
 - p=CHOOSE_DIVISOR(f)
 - (h,r)=DIVIDE(f,p)
 - f=Gfactor(h)*Gfactor(p)+Gfactor(r)
 - return(f) // factored

34

Penn ESE353 Spring 2009 -- DeHon

Factoring

- Trick is picking divisor
 - pick from kernels
 - goal minimize literals **after** resubstitution
 - Re-express design using new intermediate variables
 - Variable and complement

35

Penn ESE353 Spring 2009 -- DeHon

Extraction

- Identify cube-free expressions in many functions (common sub expressions)
- Generate kernels for each function
- select pair such that $k_1 \cap k_2$ is not a cube
- new variable from intersection
 - $v = k_1 \cap k_2$
- update functions (resubstitute)
 - $f_i = v^*(f_i / v) + r_i$
 - (similar for common cubes)

36

Penn ESE353 Spring 2009 -- DeHon

Extraction Example

- $X=ab(c(d+e)+f+g)+g$
- $Y=ai(c(d+e)+f+j)+k$

37

Penn ESE353 Spring 2009 -- DeHon

Extraction Example

- $X=ab(c(d+e)+f+g)+g$
- $Y=ai(c(d+e)+f+j)+k$
- $d+e$ kernel of both
- $L=d+e$
- $X=ab(cL+f+g)+h$
- $Y=ai(cL+f+j)+k$

38

Penn ESE353 Spring 2009 -- DeHon

Extraction Example

- $L=d+e$
- $X=ab(cL+f+g)+h$
- $Y=ai(cL+f+j)+k$
- kernels: $(cL+f+g), (cL+f+j)$
- extract: $M=cL+f$
- $X=ab(M+g)+h$
- $Y=ai(M+f)+h$

39

Penn ESE353 Spring 2009 -- DeHon

Extraction Example

- $L=d+e$
- $M=cL+f$
- $X=ab(M+g)+h$
- $Y=ai(M+j)+h$
- no kernels
- common cube: aM
- $N=aM$
- $M=cL+f$
- $L=d+e$
- $X=b(N+ag)+h$
- $Y=i(N+aj)+k$

40

Penn ESE353 Spring 2009 -- DeHon

Extraction Example

- $N=aM$
- $M=cL+f$
- $L=d+e$
- $X=b(N+ag)+h$
- $Y=i(N+aj)+k$
- Can collapse
 - L into M into N
 - Only used once
- Get larger common kernel N
 - maybe useful if components becoming too small for efficient gate implementation

41

Penn ESE353 Spring 2009 -- DeHon

Resubstitution

- Also useful to try complement on new factors
- $f=ab+ac+/b/cd$
- $X=b+c$
- $f=aX+/b/cd$
- $/X=/b/c$
- $f=aX+/Xd$
- ...extracting complements not a direct target

42

Penn ESE353 Spring 2009 -- DeHon

Good Divisors?

- Key to CHOOSE_DIVISOR in GFACTOR
- Variations to improve
 - e.g. rectangle covering (Devadas 7.4)

43

Penn ESE353 Spring 2009 -- DeHon

Summary

- Want to exploit structure in problems to reduce (contain) size
 - common subexpressions
 - structural don't cares
- Identify component elements
 - decomposition, factoring, extraction
- Division key to these operations

44

Penn ESE353 Spring 2009 -- DeHon

Admin

- Assignment 4 out today
 - Problem 1 – material before break
 - Problem 2 – programming, today's material
 - Problem 3 – next 3 lectures relevant
- Reading for Wed.
 - Handout today

45

Penn ESE353 Spring 2009 -- DeHon

Big Ideas

- Exploit freedom
 - form
- Exploit structure/sharing
 - common sub expressions
- Techniques
 - Iterative Improvement
 - Refinement/relaxation

46

Penn ESE353 Spring 2009 -- DeHon
