

ESE535: Electronic Design Automation

Day 24: April 27, 2009
Processor Verification

Penn ESE 535 Spring 2009 -- DeHon

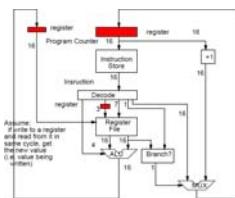

2

Penn ESE 535 Spring 2009 -- DeHon

ALU-RF Path

- Only a problem when next instruction depends on value written by immediately previous instruction
- ADD R3←R1+R2
- ADD R4←R2+R4
- ADD R5←R4+R3

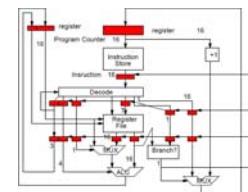

3

Penn ESE 535 Spring 2009 -- DeHon

ALU-RF Path

- Only a problem when next instruction depends on value written by immediately previous instruction
- Solve with Bypass

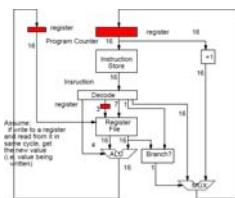

4

Penn ESE 535 Spring 2009 -- DeHon

Branch Path

- Only a problem when the instruction is a taken branch

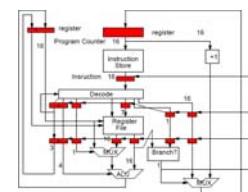

5

Penn ESE 535 Spring 2009 -- DeHon

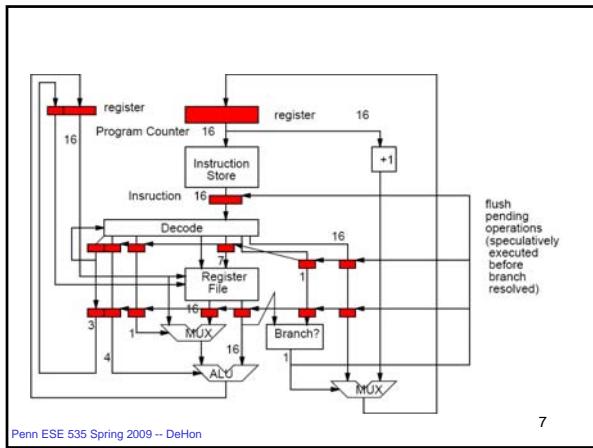

Branch Path

- Only a problem when the instruction is a taken branch
- Solve by
 - Speculating is not a taken branch
 - Preventing the speculative instruction from affecting state when branch occurs

6

Penn ESE 535 Spring 2009 -- DeHon

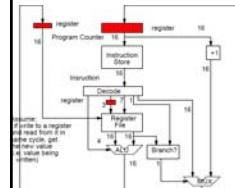

7

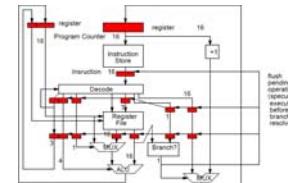

Penn ESE 535 Spring 2009 -- DeHon

Example

- Different implementations for same specification

Penn ESE 535 Spring 2009 -- DeHon

8

Today

- Specification/Implementation
- Abstraction Functions
- Correctness Condition
- Verification
- Self-Consistency

9

Penn ESE 535 Spring 2009 -- DeHon

Specification

- Abstract from Implementation
- Describes observable/correct behavior

10

Penn ESE 535 Spring 2009 -- DeHon

Implementation

- Some particular embodiment
- Should have **same** observable behavior
 - Same with respect to **important** behavior
- Includes many more details than spec.
 - How performed
 - Auxiliary/intermediate state

11

Penn ESE 535 Spring 2009 -- DeHon

Important Behavior

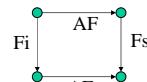

- Same output sequence for input sequence
 - Same output after some time?
- Timing?
 - Number of clock cycles to/between results?
 - Timing w/in bounds?
- Ordering?

12

Penn ESE 535 Spring 2009 -- DeHon

Abstraction Function

- Map from implementation state to specification state
 - Use to reason about implementation correctness
 - Want to guarantee: $AF(F_i(q,i)) = F_s(AF(q),i)$

13

Penn ESE 535 Spring 2009 -- DeHon

Familiar Example

- Memory Systems
 - Specification:
 - $W(A,D)$
 - $R(A) \rightarrow D$ from last D written to this address
 - Specification state: contents of memory
 - Implementation:
 - Multiple caches, VM, pipelined, Write Buffers...
 - Implementation state: much richer...

14

Penn ESE 535 Spring 2009 -- DeHon

Memory AF

- Maps from
 - State of caches/WB/etc.
- To
 - Abstract state of memory
- Guarantee $AF(F_i(q,I)) == F_s(AF(q),I)$
 - Guarantee change to state always represents the correct thing

15

Penn ESE 535 Spring 2009 -- DeHon

Abstract Timing

- For computer memory system
 - Cycle-by-cycle timing not part of specification
 - Must abstract out
- Solution:
 - Way of saying “no response”
 - Saying “skip this cycle”
 - Marking data presence
 - (tagged data presence pattern)

16

Penn ESE 535 Spring 2009 -- DeHon

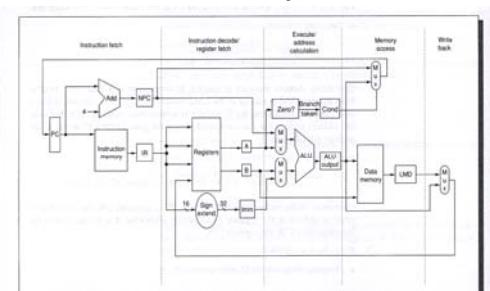

Filter to Abstract Timing

- Filter input/output sequence
- $O_s(in) \rightarrow out$
- $\text{FilterStall}(Impl_{in}) = in$
- $\text{FilterStall}(Impl_{out}) = out$
- For all sequences $Impl_{in}$
 - $\text{FilterStall}(O_s(Impl_{in})) = O_s(\text{FilterStall}(Impl_{in}))$

17

Penn ESE 535 Spring 2009 -- DeHon

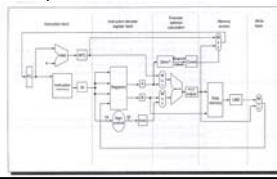

DLX Datapath

DLX unpipelined datapath from H&P (Fig. 3.1 e2, A.17 e3) 18
Penn ESE 535 Spring 2009 -- DeHon

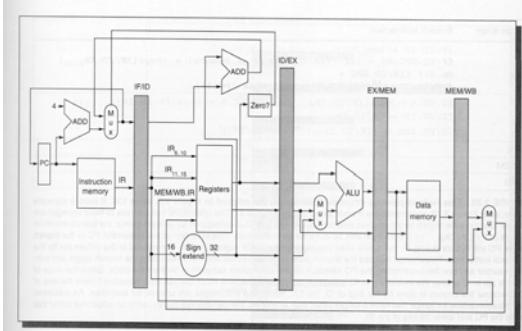

Processors

- Pipeline is big difference between specification state and implementation state.
- Specification State:
 - Register contents (incl. PC)
 - Memory contents

Penn ESE 535 Spring 2009 -- DeHon

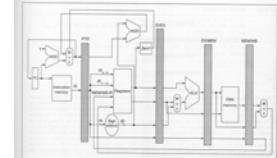

Revised Pipeline

DLX repipelined datapath from H&P (Fig. 3.22 e2, A.24 e3) 20

Penn ESE 535 Spring 2009 -- DeHon

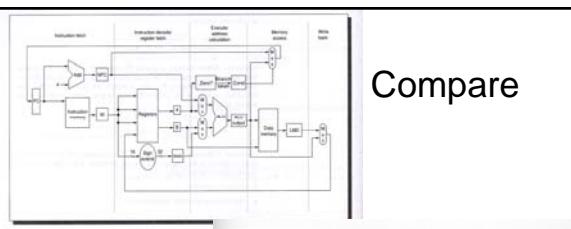

Processors

- Pipeline is big difference between specification state and implementation state.
- Specification State:
 - Register contents (incl. PC)
 - Memory contents
- Implementation State:
 - Instruction in pipeline
 - Lots of bits
 - Many more states
 - State-space explosion to track

21

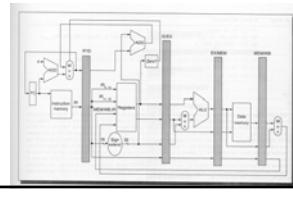

Compare

Penn ESE 535 Spring 2009 -- DeHon

Observation

- After flushing pipeline,
 - Reduce implementation state to specification state
- Can flush pipeline with series of NOPs or stall cycles

Penn ESE 535 Spring 2009 -- DeHon

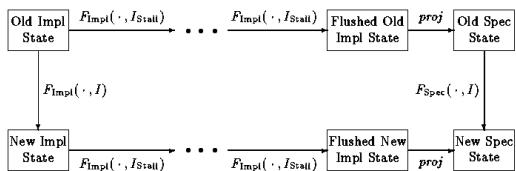

Pipelined Processor Correctness

- w = input sequence
- w_f = flush sequence
 - Enough NOPs to flush pipeline state
- For all states q and prefix w
 - $F(q, w w_f) \rightarrow F(q, w)$
 - $F(q, w w_f) \rightarrow F(q, w)$
- FSM observation
 - Finite state in pipeline
 - only need to consider finite w

Penn ESE 535 Spring 2009 -- DeHon

24

Pipeline Correspondence

[Burch+Dill, CAV'94]

25

Penn ESE 535 Spring 2009 -- DeHon

Equivalence

- Now have a logical condition for equivalence
- Need to show that it holds
 - Is a Tautology
- Or find a counter example

26

Penn ESE 535 Spring 2009 -- DeHon

Ideas

- Extract Transition Function
- Segregate datapath
- Symbolic simulation on variables
 - For q, w's
- Case splitting search
 - Generalization of SAT
 - Uses implication pruning

27

Penn ESE 535 Spring 2009 -- DeHon

Extract Transition Function

- From HDL
- Similar to what we saw for FSMs

28

Penn ESE 535 Spring 2009 -- DeHon

Segregate Datapath

- Big state blowup is in size of datapath
 - Represent data symbolically/abstractly
 - Independent of bitwidth
 - Not verify** datapath/ALU functions as part of this
 - Can verify ALU logic separately using combinational verification techniques
 - Abstract/uninterpreted functions for datapath

29

Penn ESE 535 Spring 2009 -- DeHon

Burch&Dill Logic

- Quantifier-free
- Uninterpreted functions (datapath)
- Predicates with
 - Equality
 - Propositional connectives

30

Penn ESE 535 Spring 2009 -- DeHon

B&D Logic

- Formula = **ite**(formula, formula, formula)
 - | (term=term)
 - | psym(term,...term)
 - | pvar | **true** | **false**
- Term = **ite**(formula,term,term)
 - | fsym(term,...term)
 - | tvar

Penn ESE 535 Spring 2009 -- DeHon

31

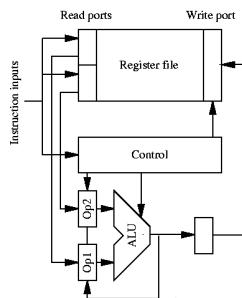

Sample

- Regfile:
 - (ite stall
regfile
(write regfile
dest
(alu op
(read regfile src1)
(read regfile src2))))

Penn ESE 535 Spring 2009 -- DeHon

32

Sample Pipeline

33

Symbolic Simulation

- Create logical expressions for outputs/state
 - Taking initial state/inputs as variables

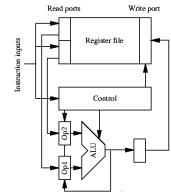

Penn ESE 535 Spring 2009 -- DeHon

35

Example Logic

- arg1:
 - (ite (**or bubble-ex**
not (= src1 dest-ex))
(**read**
(ite bubble-wb
regfile
(write regfile dest-wb result))
src1)
(alu op-ex arg1 arg2))

Penn ESE 535 Spring 2009 -- DeHon

34

Case Splitting Search

- Satisfiability Problem
- Pick an unresolved variable
- Branch on true and false
- Push implications
- Bottom out at consistent specification
- Exit on contradiction
- Pragmatic: use memoization to reuse work

Penn ESE 535 Spring 2009 -- DeHon

36

Review: What have we done?

- Reduced to simpler problem
 - Simple, clean specification
- Abstract Simulation
 - Explore all possible instruction sequences
- Abstracted the simulation
 - Focus on control
 - Divide and Conquer: control vs. arithmetic
- Used Satisfiability for reachability in search in abstract simulation

37

Penn ESE 535 Spring 2009 -- DeHon

Achievable

- Burch&Dill: Verify 5-stage pipeline DLX
 - 1 minute in 1994
 - On a 40MHz R3400 processor
- Modern machines 30+ pipestages
 - ...and many other implementation embellishments

38

Penn ESE 535 Spring 2009 -- DeHon

Self Consistency

39

Penn ESE 535 Spring 2009 -- DeHon

Self-Consistency

- Compare same implementation in two different modes of operation
 - (which should not affect result)
- Compare pipelined processor
 - To self w/ NOPs separating instructions
 - So only one instruction in pipeline at a time

40

Penn ESE 535 Spring 2009 -- DeHon

Self-Consistency

- w = instruction sequence
- $S(w) = w$ with no-ops
- Show: For all q, w
 - $F(q, w) = F(q, S(w))$

41

Penn ESE 535 Spring 2009 -- DeHon

Sample Result

Circuit	Gates	Latches	Simulation Variables	Execution Time (hr)	Equivalent Simulation Cases
A	8452	2506	49	3	6×10^{11}
B	72664	11709	144	10	2×10^{13}

Table 1. Self-consistency checking results.

[Jones, Seger, Dill/FMCAD 1996]
n.b. Jones&Seger at Intel

42

Penn ESE 535 Spring 2009 -- DeHon

Sample Result

IMPL-ABS Verification	IMPL Reach. Inv.		IMPL-ABS	
	CPU (sec)	Case Splits	CPU (sec)	Case Splits
Base Case	1.9	10	0.7	4
Issue	454.8	26,214	130.9	18,656
Dispatch	49.1	12,036	163.3	45,828
Writeback	35.0	842	42.1	4,426
Retire	29.5	8,392	307.0	59,474

ABS-ISA Verification	CPU (sec)	Case Splits
ABS Inv.	222.2	48,440
Obl. 2	37.6	530
Obl. 3	26.2	2
Obl. 4	7.0	2
Obl. 5	17.8	14

Verification running on P2-200MHz

[Skakkebæk, Jones, and Dill / CAV 1998]

43

Key Idea

- Implementation State reduces to Specification state after finite series of operations
- Abstract datapath to avoid dependence on bitwidth

44

Admin

- Last Class
- Assignment 6 due May 12th (noon)

45

Penn ESE 535 Spring 2009 -- DeHon

Big Ideas

- Proving Invariants
- Divide and Conquer
- Exploit Structure

46

Penn ESE 535 Spring 2009 -- DeHon
