

ESE535: Electronic Design Automation

Day 2: January 21, 2009
C→RTL

Penn ESE535 Spring 2009 -- DeHon

Today

- Straight-line Code
- If-conversion
- Memory
- Basic Blocks and Control Flow
- Looping
- Hyperblocks
- Common Optimizations

Penn ESE535 Spring 2009 -- DeHon

2

Day 1

Design Productivity by Approach

Penn ESE535 Spring 2009 -- DeHon

Source: Keutzer (UCB EE 244)

Today

- See how get from a language (C) to RTL level
 - ...everyone here knows C, right?
 - VHDL or Verilog?

Penn ESE535 Spring 2009 -- DeHon

4

Arithmetic Operators

- Unary Minus (Negation) $-a$
- Addition (Sum) $a + b$
- Subtraction (Difference) $a - b$
- Multiplication (Product) $a * b$
- Division (Quotient) a / b
- Modulus (Remainder) $a \% b$

Things might have an a hardware operator for...

Penn ESE535 Spring 2009 -- DeHon

5

Bitwise Operators

- Bitwise Left Shift $a \ll b$
- Bitwise Right Shift $a \gg b$
- Bitwise One's Complement $\sim a$
- Bitwise AND $a \& b$
- Bitwise OR $a | b$
- Bitwise XOR $a \wedge b$

Things might have an a hardware operator for...

Penn ESE535 Spring 2009 -- DeHon

6

Comparison Operators

- Less Than $a < b$
- Less Than or Equal To $a \leq b$
- Greater Than $a > b$
- Greater Than or Equal To $a \geq b$
- Not Equal To $a \neq b$
- Equal To $a == b$
- Logical Negation $!a$
- Logical AND $a \&\& b$
- Logical OR $a || b$

Things might have an a hardware operator for...

Penn ESE535 Spring 2009 -- DeHon

7

Build complex expressions

- $a*x+b*x+c$
- $a*(x+b)*x+c$
- $((a+10)*b < 100)$

A connected set of operators
→ Graph of operators

Penn ESE535 Spring 2009 -- DeHon

8

C Assignment

- Basic assignment statement
- Location = expression
- $F = a*x*x + b*x + c$

Penn ESE535 Spring 2009 -- DeHon

9

Straight-line code

- Just a sequence of assignments
- What does this mean?

```
g=a*x;
h=b+g;
i=h*x;
j=i+c;
```

Penn ESE535 Spring 2009 -- DeHon

10

Variable Reuse

- Variables (locations) define flow between computations
- Locations (variables) are reusable

```
t=a*x;
r=t*x;
t=b*x;
r=r+t;
r=r+c;
```

Penn ESE535 Spring 2009 -- DeHon

11

Variable Reuse

- Variables (locations) define flow between computations
- Locations (variables) are reusable

```
t=a*x; t=a*x;
r=t*x; r=t*x;
t=b*x; t=b*x;
r=r+t; r=r+t;
r=r+c; r=r+c;
```

- Sequential assignment semantics tell us which definition goes with which use.
 - Use gets most recent preceding definition.

Penn ESE535 Spring 2009 -- DeHon

12

Dataflow

- Can turn sequential assignments into dataflow graph through def→use connections

```

t=a*x;   t=a*x;
r=t*x;   r=t*x;
t=b*x;   t=b*x;
r=r+t;   r=r+t;
r=r+c;   r=r+c;
    
```

Penn ESE535 Spring 2009 -- DeHon

13

Dataflow Height

- $t=a*x;$ $t=a*x;$
 $r=t*x;$ $r=t*x;$
 $t=b*x;$ $t=b*x;$
 $r=r+t;$ $r=r+t;$
 $r=r+c;$ $r=r+c;$
- Height (delay) of DF graph may be less than # sequential instructions.

Penn ESE535 Spring 2009 -- DeHon

14

Simple Control Flow

- If (cond) { ... } else { ... }
- Assignments become conditional
- In simplest cases, can treat as dataflow node

Penn ESE535 Spring 2009 -- DeHon

15

Simple Conditionals

```

if (a>b)
  c=b*c;
else
  c=a*c;
    
```

Penn ESE535 Spring 2009 -- DeHon

16

Simple Conditionals

```

v=a;
if (b>a)
  v=b;
    
```

- If not assigned, value flows from before assignment

Penn ESE535 Spring 2009 -- DeHon

17

Simple Conditionals

```

max=a;
min=a;
if (a>b)
  min=b;
  c=1;
else
  max=b;
  c=0;
    
```

- May (re)define many values on each branch.

Penn ESE535 Spring 2009 -- DeHon

18

C Memory Model

- One big linear address space of locations
- Most recent definition to location is value
- Sequential flow of statements

Penn ESE535 Spring 2009 -- DeHon

19

C Memory Operations

Read/Use

- $a = *p;$
- $a = p[0]$
- $a = p[c*10+d]$

Write/Def

- $*p = 2*a + b;$
- $p[0] = 23;$
- $p[c*10+d] = a*x + b;$

Penn ESE535 Spring 2009 -- DeHon

20

Memory Operation Challenge

- Memory just a location
- But **memory expressions** can refer to variable locations
 - Does $*q$ and $*p$ refer to same location?
 - $*p$ and $p[c*10+d]$?
 - $p[0]$ and $p[c*10+d]$?
 - $p[f(a)]$ and $p[q(b)]$?

Penn ESE535 Spring 2009 -- DeHon

21

Pitfall

- $P[i] = 23$
- $P[j] = 17$
- $r = 10 + P[i]$
- $s = P[j] * 12$

- Could do:
 $P[i] = 23; P[j] = 17;$
 $r = 10 + P[i]; s = P[j] * 12$

....unless $i == j$

Penn ESE535 Spring 2009 -- DeHon

22

C Pointer Pitfalls

- $*p = 23$
- $*q = 17$
- $r = 10 + *p;$
- $s = *q * 12;$
- Similar limit if $p == q$

Penn ESE535 Spring 2009 -- DeHon

23

C Memory/Pointer Sequentialization

- Must preserve ordering of memory operations
 - A read cannot be moved before write to memory which may redefine the location of the read
 - Conservative: any write to memory
 - Sophisticated analysis may allow us to prove independence of read and write
 - Writes which may redefine the same location cannot be reordered

Penn ESE535 Spring 2009 -- DeHon

24

Consequence

- Expressions and operations through variables (whose address is never taken) can be executed at any time
 - Just preserve the dataflow
- Memory assignments must execute in strict order
 - Ideally: partial order
 - Conservatively: strict sequential order of C

Penn ESE535 Spring 2009 -- DeHon

25

Forcing Sequencing

- Demands we introduce some discipline for deciding when operations occur
 - Could be a FSM
 - Could be an explicit dataflow token
 - Callahan uses control register
- Other uses for timing control
 - Variable delay blocks
 - Looping
 - Complex control

Penn ESE535 Spring 2009 -- DeHon

26

Scheduled Memory Operations

Source: Callahan

Penn ESE535 Spring 2009 -- DeHon

Basic Blocks

- Sequence of operations with
 - Single entry point
 - Once enter execute all operations in block
 - Set of exits at end
- Can dataflow schedule operations within a basic block
 - As long as preserve memory ordering

Penn ESE535 Spring 2009 -- DeHon

28

Connecting Basic Blocks

- Connect up basic blocks by routing control flow token
 - May enter from several places
 - May leave to one of several places

Penn ESE535 Spring 2009 -- DeHon

29

Basic Blocks for if/then/else

Source: Callahan

Penn ESE535 Spring 2009 -- DeHon

Loops

```
sum=0;
for (i=0;i<imax;i++)
    sum+=i;
r=sum<<2;
```

Penn ESE535 Spring 2009 -- DeHon

31

Beyond Basic Blocks

- Basic blocks tend to be limiting
- Runs of straight-line code are not long
- For good hardware implementation
 - Want more parallelism

Penn ESE535 Spring 2009 -- DeHon

32

Hyperblocks

- Can convert if/then/else into dataflow
 - If/mux-conversion
- Hyperblock
 - Single entry point
 - No internal branches
 - Internal control flow provided by mux conversion
 - May exit at multiple points

Penn ESE535 Spring 2009 -- DeHon

33

Basic Blocks → Hyperblock

Source: Callahan

Penn ESE535 Spring 2009 -- DeHon

Hyperblock Benefits

- More code → typically more parallelism
 - Shorter critical path
- Optimization opportunities
 - Reduce work in common flow path
 - Move logic for uncommon case out of path
 - Makes smaller faster

Penn ESE535 Spring 2009 -- DeHon

35

Common Case Height Reduction

Source: Callahan

Penn ESE535 Spring 2009 -- DeHon

36

- ### Optimizations
- Constant propagation: $a=10; b=c[a];$
 - Copy propagation: $a=b; c=a+d; \rightarrow c=b+d;$
 - Constant folding: $c[10*10+4]; \rightarrow c[104];$
 - Identity Simplification: $c=1*a+0; \rightarrow c=a;$
 - Strength Reduction: $c=b*2; \rightarrow c=b<<1;$
 - Dead code elimination
 - Common Subexpression Elimination:
 - $C[x*100+y]=A[x*100+y]+B[x*100+y]$
 - $t=x*100+y; C[t]=A[t]+B[t];$
 - Operator sizing: for $(i=0; i<100; i++) b[i]=(a\&0xff+i);$
- Penn ESE535 Spring 2009 -- DeHon

- ### Concerns
- Parallelism in hyperblock
 - Especially if memory sequentialized
 - Disambiguate memories?
 - Allow multiple memory banks?
 - Only one hyperblock active at a time
 - Share hardware between blocks?
 - Data only used from one side of mux
 - Share hardware between sides?
 - Most logic in hyperblock idle?
 - Couldn't we pipeline execution?
- Penn ESE535 Spring 2009 -- DeHon

- ### Summary
- Language (here C) defines meaning of operations
 - Dataflow connection of computations
 - Sequential precedents constraints to preserve
 - Create basic blocks
 - Link together
 - Merge into hyperblocks with if-conversion
 - Result is logic and registers $\rightarrow$ RTL
- Penn ESE535 Spring 2009 -- DeHon

Admin

- Assignment 1 out
- Reading for Monday

Big Ideas:

- Dataflow
- Mux-conversion
- Specialization
- Common-case optimization
