

ESE535: Electronic Design Automation

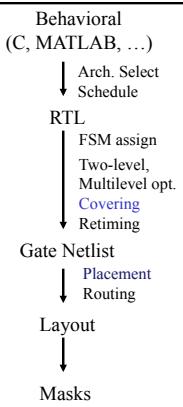

Day 7: February 7, 2011
Clustering
(LUT Mapping, Delay)

Penn ESE535 Spring 2011 – DeHon

Today

- How do we map to LUTs?
- What happens when
 - IO dominates
 - Delay dominates?
- Lessons...
 - for non-LUTs
 - for delay-oriented partitioning

2

Penn ESE535 Spring 2011 – DeHon

LUT Mapping

- **Problem:** Map logic netlist to LUTs
 - minimizing area
 - minimizing delay
- Old problem?
 - Technology mapping? (Day 2)
 - **How big is the library?**
 - 2^{2^K} gates in library

3

Penn ESE535 Spring 2011 – DeHon

Simplifying Structure

- K-LUT can implement any K-input function

4

Penn ESE535 Spring 2011 – DeHon

Cost Function

- **Delay:** number of LUTs in critical path
 - doesn't say delay in LUTs or in wires
 - does assume uniform interconnect delay
- **Area:** number of LUTs
 - Assumes adequate interconnect to use LUTs

5

Penn ESE535 Spring 2011 – DeHon

LUT Mapping

- NP-Hard in general
- Fanout-free -- can solve optimally *given* decomposition
 - (but which one?)
- Delay optimal mapping achievable in Polynomial time
- Area w/ fanout NP-complete

6

Penn ESE535 Spring 2011 – DeHon

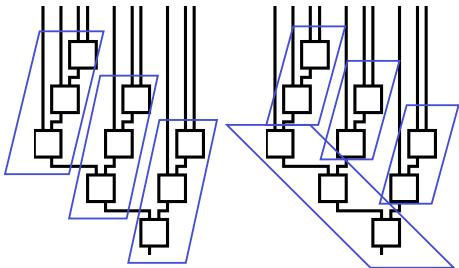

Preliminaries

- What matters/makes this interesting?
 - Area / Delay target
 - Decomposition
 - Fanout
 - replication
 - reconvergent

7

Penn ESE535 Spring 2011 – DeHon

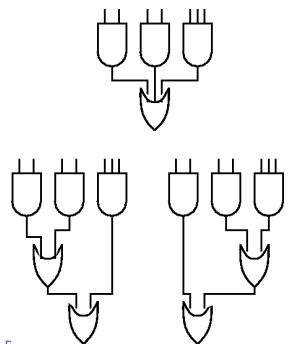

Costs: Area vs. Delay

8

Penn ESE535 Spring 2011 – DeHon

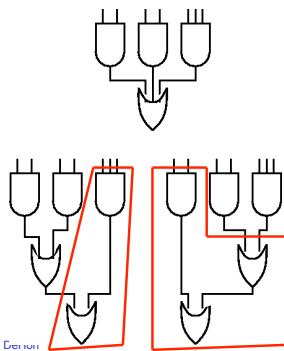

Decomposition

9

Penn ESE535 Spring 2011 – DeHon

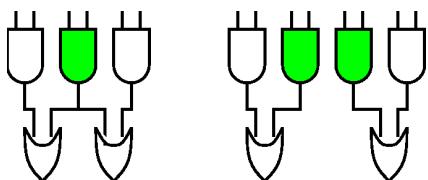

Decomposition

10

Penn ESE535 Spring 2011 – DeHon

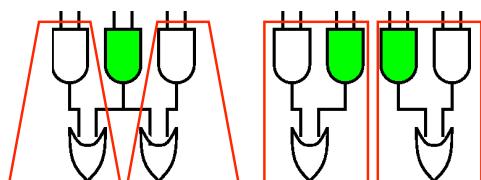

Fanout: Replication

11

Penn ESE535 Spring 2011 – DeHon

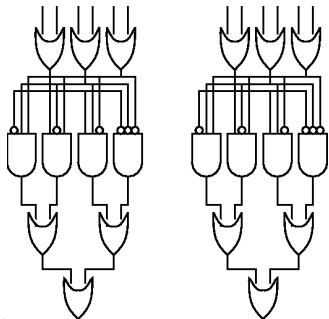

Fanout: Replication

12

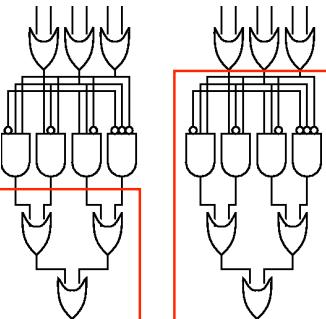

Penn ESE535 Spring 2011 – DeHon

Fanout: Reconvergence

Penn ESE535 Spring 2011 -- DeHon

Fanout: Reconvergence

Penn ESE535 Spring 2011 -- DeHon

Monotone Property

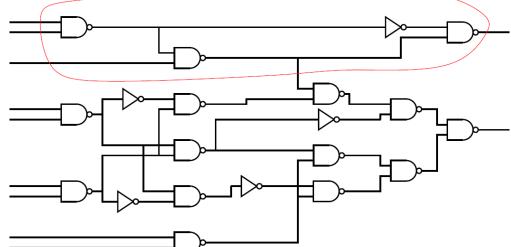

- Does cost function increase monotonically as more of the graph is included? (do all subsets have property)
 - gate count?
 - I/o?
- Important?
 - How far back do we need to search?

15

Penn ESE535 Spring 2011 -- DeHon

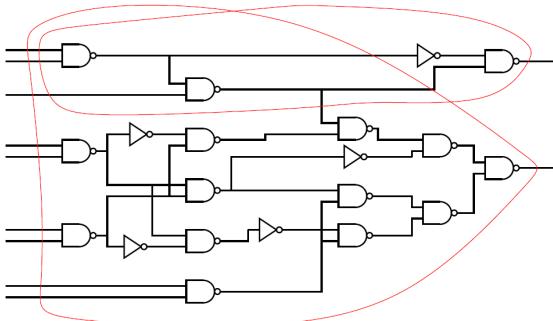

Definition

- **Cone:** set of nodes in the recursive fanin of a node

Penn ESE535 Spring 2011 -- DeHon

Example Cones

Penn ESE535 Spring 2011 -- DeHon

Delay

Penn ESE535 Spring 2011 -- DeHon

Dynamic Programming

- Optimal covering of a logic cone is:
 - Minimum cost (all possible coverings)
- Evaluate costs of each node based on:
 - cover node
 - cones covering each fanin to node cover
- Evaluate node costs in topological order
- **Key:** are calculating optimal solutions to subproblems
 - only have to evaluate covering options at each node

Penn ESE535 Spring 2011 – DeHon

19

Flowmap

- **Key Idea:**
 - LUT holds anything with K inputs
 - Use network flow to find cuts
 - = logic can pack into LUT including reconvergence
 - ...allows replication
 - Optimal depth arise from optimal depth solution to subproblems

Penn ESE535 Spring 2011 – DeHon

20

MaxFlow

- Set all edge flows to zero
 - $F[u,v]=0$
- While there is a path from s,t ,
 - (breadth-first-search)
 - for each edge in path $f[u,v]=f[u,v]+1$
 - $f[v,u]=-f[u,v]$
 - When $c[v,u]=f[v,u]$ remove edge from search
- $O(|E|^* \text{cutsize})$

Penn ESE535 Spring 2011 – DeHon

21

Flowmap

- Delay objective:
 - minimum height, K-feasible cut
 - i.e. cut no more than K edges
 - start by bounding fanin $\leq K$
- Height of node will be:
 - height of predecessors or
 - one greater than height of predecessors
- Check shorter first

Penn ESE535 Spring 2011 – DeHon

22

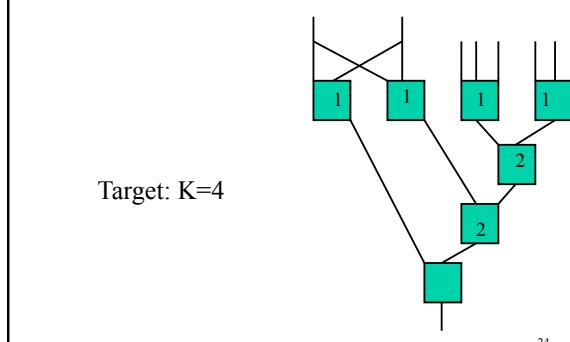

Flowmap

- Construct flow problem
 - sink \leftarrow target node being mapped
 - source \leftarrow start set (primary inputs)
 - flow infinite into start set
 - flow of one on each link
 - to see if height same as predecessors
 - collapse all predecessors of maximum height into sink (single node, cut must be above)
 - height +1 case is trivially true

Penn ESE535 Spring 2011 – DeHon

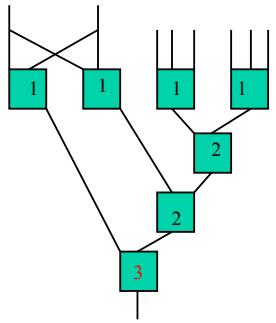

23

Example Subgraph

24

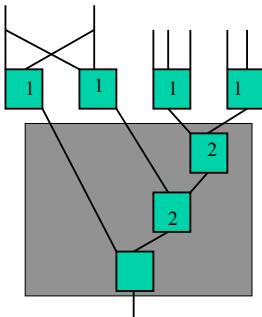

Trivial: Height +1

25

Penn ESE535 Spring 2011 – DeHon

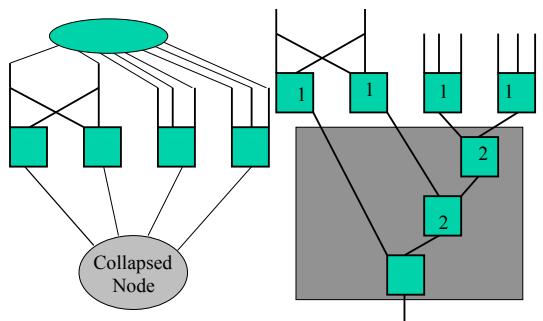

Collapse at max height

26

Penn ESE535 Spring 2011 – DeHon

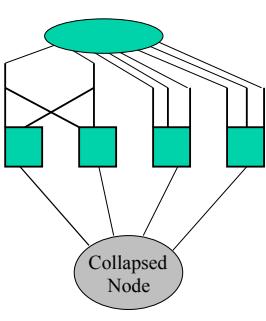

Collapse at max height

27

Penn ESE535 Spring 2011 – DeHon

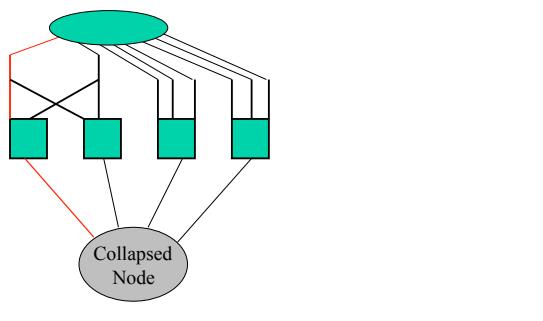

Augmenting Flows

28

Penn ESE535 Spring 2011 – DeHon

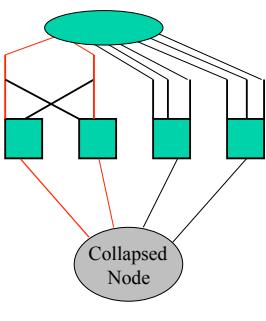

Augmenting Flows

29

Penn ESE535 Spring 2011 – DeHon

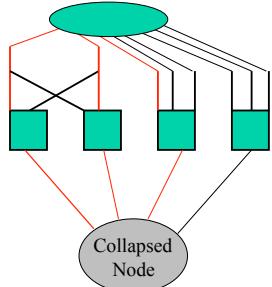

Augmenting Flows

30

Penn ESE535 Spring 2011 – DeHon

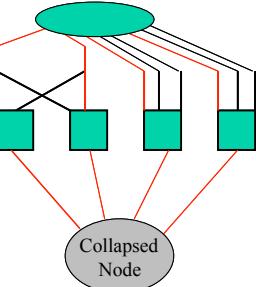

Augmenting Flows

31

Penn ESE535 Spring 2011 – DeHon

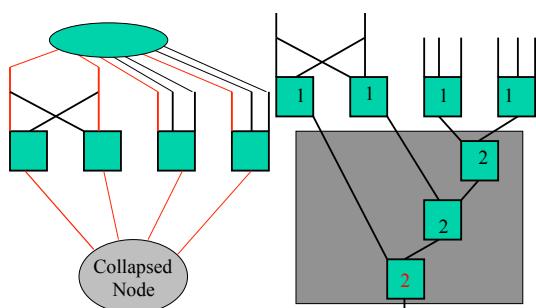

Augmenting Flows

32

Penn ESE535 Spring 2011 – DeHon

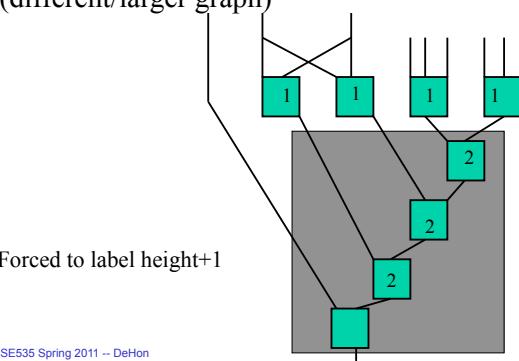

Collapse at max height

33

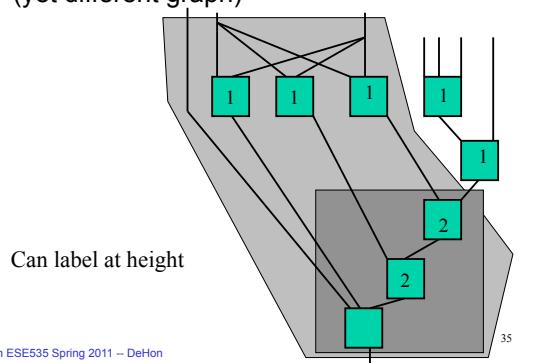

Penn ESE535 Spring 2011 – DeHon

Collapse not work (different/larger graph)

Penn ESE535 Spring 2011 – DeHon

Reconvergent fanout (yet different graph)

35

Can label at height

Penn ESE535 Spring 2011 – DeHon

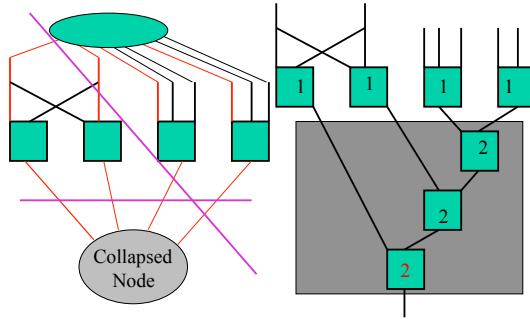

Flowmap

- Max-flow Min-cut algorithm to find cut
- Use augmenting paths until discover max flow > K
- $O(K|e|)$ time to discover K-feasible cut
 - (or that does not exist)
- Depth identification: $O(KN|e|)$

Penn ESE535 Spring 2011 – DeHon

36

Mincut may not be unique

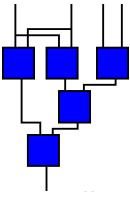

Penn ESE535 Spring 2011 – DeHon

37

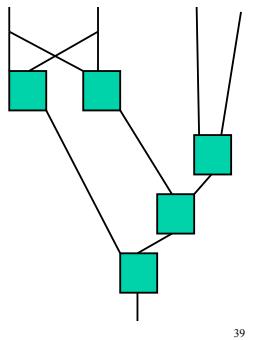

Flowmap

- Min-cut may not be unique
- To minimize area achieving delay optimum
 - find max volume min-cut
 - Compute max flow \Rightarrow find min cut
 - remove edges consumed by max flow
 - DFS from source
 - Compliment set is max volume set

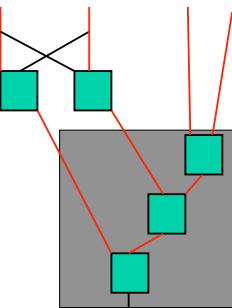

Penn ESE535 Spring 2011 – DeHon

Graph

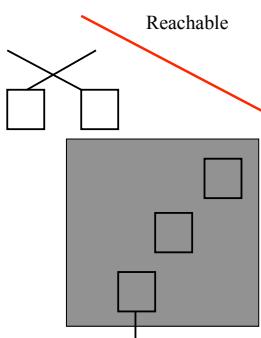

39

Graph: maxflow (K=4)

40

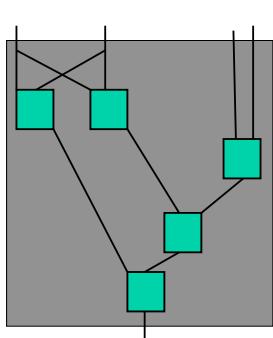

Graph: BFS source

41

Penn ESE535 Spring 2011 – DeHon

Max Volume min-cut

42

Penn ESE535 Spring 2011 – DeHon

Flowmap

- Covering from labeling is straightforward
 - process in reverse topological order
 - allocate identified K-feasible cut to LUT
 - remove node
 - postprocess to minimize LUT count
- Notes:
 - replication implicit (covered multiple places)
 - nodes purely internal to one or more covers may not get their own LUTs

43

Penn ESE535 Spring 2011 – DeHon

Flowmap Roundup

- Label
 - Work from inputs to outputs
 - Find max label of predecessors
 - Collapse new node with all predecessors at this label
 - Can find flow cut $\leq K$?
 - Yes: mark with label (find max-volume cut extent)
 - No: mark with label+1
- Cover
 - Work from outputs to inputs
 - Allocate LUT for identified cluster/cover
 - Recurse covering selection on inputs to identified LUT

44

Penn ESE535 Spring 2011 – DeHon

Area

45

Penn ESE535 Spring 2011 – DeHon

DF-Map

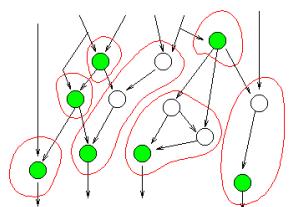

- Duplication Free Mapping
 - can find optimal area under this constraint
 - (but optimal area may not be duplication free)

[Cong+Ding, IEEE TR VLSI Sys. V2n2p137]

46

Penn ESE535 Spring 2011 – DeHon

Maximum Fanout Free Cones

MFFC: bit more general than trees

47

Penn ESE535 Spring 2011 – DeHon

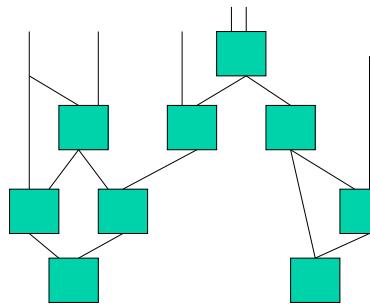

MFFC

- Follow cone backward
- end at node that fans out (has output) outside the code

48

Penn ESE535 Spring 2011 – DeHon

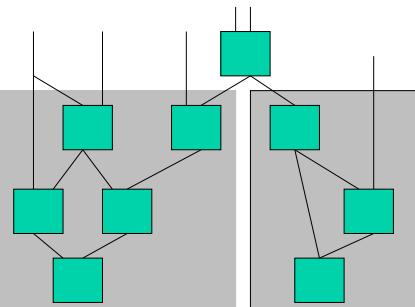

MFFC example

49

Penn ESE535 Spring 2011 – DeHon

MFFC example

Penn ESE535 Spring 2011 – DeHon

DF-Map

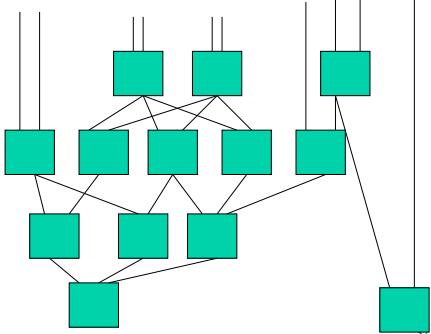

- Partition into graph into MFFCs
- Optimally map each MFFC
- In dynamic programming
 - for each node
 - examine **each** K-feasible cut
 - note:** this is very different than flowmap where only had to examine a single cut
 - pick cut to minimize cost
 - $- 1 + \Sigma$ MFFCs for fanins

51

Penn ESE535 Spring 2011 – DeHon

102

Lecture Ended Here

Penn ESE535 Spring 2011 – DeHon

103

Composing

- Don't need minimum delay off the critical path
- Don't always want/need minimum delay
- Composite:
 - map with flowmap
 - Greedy decomposition of "most promising" non-critical nodes
 - DF-map these nodes

Penn ESE535 Spring 2011 – DeHon

104

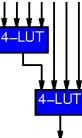

Variations on a Theme

Penn ESE535 Spring 2011 – DeHon

105

Applicability to Non-LUTs?

- E.g. LUT Cascade
 - can handle some functions of K input:
- How apply?

Penn ESE535 Spring 2011 – DeHon

106

Adaptable to Non-LUTs

- Sketch:
 - Initial decomposition to nodes that will fit
 - Find max volume, min-height K-feasible cut
 - ask if logic block will cover
 - yes \Rightarrow done
 - no \Rightarrow exclude one (or more) nodes from block and repeat
 - exclude == collapse into start set nodes
 - this makes heuristic

Penn ESE535 Spring 2011 – DeHon

107

Partitioning?

- Effectively partitioning logic into clusters
 - LUT cluster
 - unlimited internal "gate" capacity
 - limited I/O (K)
 - simple delay cost model
 - 1 cross between clusters
 - 0 inside cluster

Penn ESE535 Spring 2011 – DeHon

108

Partitioning

- Clustering
 - if strongly I/O limited, same basic idea works for partitioning to components
 - typically: partitioning onto multiple FPGAs
 - assumption: inter-FPGA delay >> intra-FPGA delay
 - w/ area constraints
 - similar to non-LUT case
 - make min-cut
 - will it fit?
 - Exclude some LUTs and repeat

109

Penn ESE535 Spring 2011 – DeHon

Clustering for Delay

- W/ no IO constraint
- area is monotone property
- DP-label forward with delays
 - grab up largest labels (greatest delays) until fill cluster size
- Work backward from outputs creating clusters as needed

110

Penn ESE535 Spring 2011 – DeHon

Area and IO?

- Real problem:
 - FPGA/chip partitioning
- Doing both optimally is NP-hard
- Heuristic around IO cut first should do well
 - (e.g. non-LUT slide)
 - [Yang and Wong, FPGA'94]

111

Penn ESE535 Spring 2011 – DeHon

Partitioning

- To date:
 - primarily used for 2-level hierarchy
 - i.e. intra-FPGA, inter-FPGA
- Open/promising
 - adapt to multi-level for delay-optimized partitioning/placement on fixed-wire schedule
 - localize critical paths to smallest subtree possible?

112

Penn ESE535 Spring 2011 – DeHon

Summary

- Optimal LUT mapping NP-hard in general
 - fanout, replication,
- K-LUTs makes delay optimal feasible
 - **single constraint:** IO capacity
 - **technique:** max-flow/min-cut
- Heuristic adaptations of basic idea to capacity constrained problem
 - promising area for interconnect delay optimization

113

Penn ESE535 Spring 2011 – DeHon

Admin

- Assignment 1 (Graded)
- Assignment 2
 - Hope you are into programming
 - Office hour T4:30pm
 - I hope to give 2a quick look soon
- Reading Wed. on web

114

Penn ESE535 Spring 2011 – DeHon

Today's Big Ideas:

- IO may be a dominant cost
 - limiting capacity, delay
- Exploit structure: K-LUTs
- Mixing dominant modes
 - multiple objectives
- Define optimally solvable subproblem
 - duplication free mapping
