

# ESE535: Electronic Design Automation

Day 9: February 11, 2013  
Placement  
(Intro, Constructive)

Penn ESE535 Spring 2013 -- DeHon

## Today

- 2D Placement Problem
- Partitioning → Placement
- Quadrisection
- Refinement

Penn ESE535 Spring 2013 -- DeHon

2

## Placement

- **Problem:** Pick locations for all building blocks
  - minimizing energy, delay, area
- really:
  - minimize wire length
  - minimize channel density

Penn ESE535 Spring 2013 -- DeHon

3

## Bad Placement

- How bad can it be?
  - Area
  - Delay
  - Energy

Penn ESE535 Spring 2013 -- DeHon

4

## Preclass Channel Widths

- Channel Width for Problem 1?

Penn ESE535 Spring 2013 -- DeHon

5

## Preclass Channel Widths

- Channel Width for Problem 2?

Penn ESE535 Spring 2013 -- DeHon

6

## Bad: Area

- All wires cross bisection
- $O(N^2)$  area
- good:  $O(N)$

Penn ESE535 Spring 2013 -- DeHon

7

## Delay

- How bad can delay be?

Penn ESE535 Spring 2013 -- DeHon

8

## Delay

- How good can delay be?

Penn ESE535 Spring 2013 -- DeHon

9

## Bad: Delay

- All critical path wires cross chip
- Delay  $= O(|PATH| * L_{side})$   
– [and  $L_{side}$  is  $O(N)$ ]
- good:  $O(|PATH| * L_g)$
- compare 10ps gates to many nanoseconds to cross chip

Penn ESE535 Spring 2013 -- DeHon

10

## Clock Cycle Radius

- Radius of logic can reach in one cycle (45 nm)
  - 1 Cycle Radius = 10
    - Few hundred PEs
  - Chip side 600-700 PE
    - 400-500 thousand PEs
  - 100s of cycles to cross

Penn ESE535 Spring 2013 -- DeHon

11

## Bad: Energy

- All wires cross chip:
  - $O(L_{side})$  long  $\rightarrow O(L_{side})$  capacitance per wire
  - Recall Area  $\rightarrow O(N^2)$
  - So  $L_{side} \rightarrow O(N)$
  - $\times O(N)$  wires  $\rightarrow O(N^2)$  capacitance
- Good:
  - $O(1)$  long wires  $\rightarrow O(N)$  capacitance

Penn ESE535 Spring 2013 -- DeHon

12

## Manhattan Distance

- Horizontal and Vertical Routing:  
Manhattan distance  
 $|X_i - X_j| + |Y_i - Y_j|$
- Contrast:  
Euclidean distance  
 $\sqrt{(x_i - x_j)^2 + (y_i - y_j)^2}$

Penn ESE535 Spring 2013 -- DeHon

## Distance

- Can we place everything close?

Penn ESE535 Spring 2013 -- DeHon

## Illustration

- Consider a complete tree
  - nand2's, no fanout
  - N nodes
- Logical circuit depth?
- Circuit Area?
- Side Length?
- Average wire length between nand gates? (lower bound)

Penn ESE535 Spring 2013 -- DeHon

## "Closeness"

- Try placing "everything" close

Manhattan Distance	Places	Transitive Fanin
1	4	4
2	8	16
3	12	64
i	i	i
n	4n	4^n

Penn ESE535 S

## Alternate Wire Length Illustration

- Consider a cut width  
 $F(N) > \sqrt{N}$
- If optimally place all  
 $F(N)$  producers right next to bisection
  - How many cells deep is the producer farthest from the bisection?

Penn ESE535 Spring 2013 -- DeHon

## Generalizing Interconnect Lengths

$$BW = F(N) > \sqrt{N}$$

- Large cut widths  
imply long wires

Penn ESE535 Spring 2013 -- DeHon

19

## Placement Problem Characteristics

- Familiar
  - NP Complete
  - local, greedy not work
  - greedy gets stuck in local minima

Penn ESE535 Spring 2013 -- DeHon

20

## Constructive Placement

Penn ESE535 Spring 2013 -- DeHon

21

## Basic Idea

- Partition (bisect) to define halves of chip
  - minimize wire crossing
- Recurse to refine
- When get down to single component, done

Penn ESE535

22

## Adequate?

- Does recursive bisection capture the primary constraints of two-dimensional placement?

Penn ESE535 Spring 2013 -- DeHon

23

## Problems

- Greedy, top-down cuts
  - maybe better pay cost early?
- Two-dimensional problem
  - (often) no real cost difference between H and V cuts
- Interaction between subtrees
  - not modeled by recursive bisect

Penn ESE535 Spring 2013 -- DeHon

24

## Interaction

Penn ESE535 Spring 2013 -- DeHon

25

## Example

Ideal split  
(not typical)

"Equivalent" split  
ignoring external constraints  
Practically -- makes all H  
cuts also be V cuts

Penn ESE535 Spring 2013 -- DeHon

26

## Interaction

Penn ESE535 Spring 2013 -- DeHon

27

## Problem

- Need to keep track of where things are
  - outside of current partition
  - include costs induced by above
- ...but don't necessarily know where things are
  - still solving problem

Penn ESE535 Spring 2013 -- DeHon

28

## Improvement: Ordered

- Order operations
- Keep track of existing solution
- Use to constrain or pass costs to next subproblem

Penn ESE535 Spring 2013 -- DeHon

29

## Improvement: Ordered

- Order operations
- Keep track of existing solution
- Use to constrain or pass costs to next subproblem
- Flow cut
  - use existing in src/sink
  - A nets = src, B nets = sink

Penn ESE535 Spring 2013 -- DeHon

30

## Improvement: Ordered

- Order operations
- Keep track of existing solution
- Use to constrain or pass costs to next subproblem
- Flow cut
  - use existing in src/sink
  - A nets = src, B nets = sink
- FM: start with fixed, unmovable nets for side-biased inputs

Penn ESE535 Spring 2013 -- DeHon

31

## Improvement: Constrain

- Partition once
- Constrain movement within existing partitions
- Account for both H and V crossings
- Partition next
  - (simultaneously work parallel problems)
  - easy modification to FM

Penn ESE535 Spring 2013 -- DeHon

32

## Constrain Partition

Solve AB and CD concurrently.

Penn ESE535 Spring 2013 -- DeHon

33

## Improvement: Quadrisect

- Solve more of problem at once
- Quadrisect:
  - partition into 4 bins simultaneously
  - keep track of costs all around

Penn ESE535 Spring 2013 -- DeHon

34

## Quadrisect

- Modify FM to work on multiple buckets
- k-way has:
  - $k(k-1)$  buckets
  - $|from| \times |to|$
  - quad  $\rightarrow 12$
- reformulate gains
- update still  $O(1)$

Penn ESE535 Spring 2013 -- DeHon

35

## Quadrisect

- Cases (15):
  - (1 partition)  $\rightarrow 4$
  - (2 part)  $\rightarrow 6 = (4 \text{ choose } 2)$
  - (3 part)  $\rightarrow 4 = (4 \text{ choose } 3)$
  - (4 part)  $\rightarrow 1$

Penn ESE535 Spring 2013 -- DeHon

36

## Recurse

- Keep outside constraints
  - (cost effects)
- **Problem?**
  - Don't know detail place
- **What can we do?**
  - Model as at center of unrefined region

Penn ESE535 Spring 2013 -- DeHon

37

## Option: Terminal Propagation

- Abstract inputs as terminals
- Partition based upon
- Represent cost effects on placement/refinement decisions

Penn ESE535 Spring 2013 -- DeHon

38

## Option: Refine

- Keep refined placement
- Use in cost estimates

Penn ESE535 Spring 2013 -- DeHon

39

## Problem

- Still have ordering problem
- **What is the problem?**
- Earlier subproblems solved with weak constraints from later
  - (cruder placement estimates)
- Solved previous case by flattening
- **Why might not be satisfied with that?**
- In extreme give up divide and conquer
- **Alternative?**

Penn ESE535 Spring 2013 -- DeHon

40

## Iterate

- After solve later problems
- "Relax" solution
- Solve earlier problems again with refined placements (cost estimates)
- Repeat until converge

Penn ESE535 Spring 2013 -- DeHon

41

## Iteration/Cycling

- General technique to deal with *phase-ordering* problem
  - what order do we perform transformations, make decisions?
  - How get accurate information to everyone
- Still basically greedy

Penn ESE535 Spring 2013 -- DeHon

42

## Refinement

- Relax using overlapping windows
- Deal with edging effects
- Huang&Kahng claim 10-15% improve
  - cycle
  - overlap

Penn ESE535 Spring 2013 -- DeHon

43

## Possible Refinement

- Allow unbalanced cuts
  - most things still work
  - just distort refinement groups
  - allowing unbalance using FM quadrissection looks a bit tricky
  - gives another 5-10% improvement

Penn ESE535 Spring 2013 -- DeHon

44

## Runtime

- Each gain update still  $O(1)$ 
  - (bigger constants)
  - so, FM partition pass still  $O(N)$
- $O(1)$  iterations expected
- assume  $O(1)$  overlaps exploited
- $O(\log(N))$  levels
- Total:  $O(N \log(N))$ 
  - very fast compared to typical annealing
    - (annealing next time)

Penn ESE535 Spring 2013 -- DeHon

45

## Quality: Area

Gordian-L: Analytic global placer  
DOMINO: network flow detail

Case	GORD-L	DOMINO	QUAD	Impr.	
				GOR-L	DOMI
prim1	10500	10059	10208	2.8%	-1.5%
prim2	45994	43705	44478	3.3%	-1.8%
ind2	436300	417264	380194	12.9%	8.9%
ind3	1121000	1048673	970068	13.5%	7.5%
fract	400	383	380	5.0%	0.8%
C1908	1858	1767	1830	1.5%	-3.6%
C5315	6220	5922	6185	0.6%	-4.4%
C6288	8794	8339	8312	5.5%	0.3%
s1423	2334	2208	2265	3.0%	-2.6%
s1488	2680	2558	2470	7.8%	3.4%
s5378	8609	8182	8208	4.7%	-0.3%
s9234	14848	14023	13848	6.7%	1.3%
s13207	31284	29995	28161	9.9%	6.1%
s15850	37020	35591	33625	9.2%	5.5%
struct	4160	3967	4196	-0.9%	-5.8%
biomed	34677	33712	33787	2.6%	-0.2%
avq_s	95648	92355	95867	-0.2%	-3.8%
avq_l	100650	97825	101930	-1.3%	-4.2%
Impr.				4.8%	0.3%

Penn ESE535 Spring 2013 -- DeHon

[Huang&Kahng/ISPD1997]

46

## Quality: Delay

- Weight edges based on criticality
  - Periodic, interleaved timing analysis

Case	Measure	Max Intrinsic Path Delay	TW7.0	Timing-QUAD
fract	Delay	10.6	17.9	18.1
	MSTx100		349	347
struct	Delay	40.0	78.8	79.3
	MSTx100		5130	5103
avq_s	Delay	37.3	61.4	60.9
	MSTx100		46763	47153

Penn ESE535 Spring 2013 -- DeHon

47

## Uses

- Good by self
- Starting point for simulated annealing
  - speed convergence
- With synthesis (both high level and logic)
  - get a quick estimate of physical effects
  - (play role in estimation/refinement at larger level)
- Early/fast placement
  - before willing to spend time looking for best
- For fast placement where time matters
  - FPGAs, online placement?

Penn ESE535 Spring 2013 -- DeHon

48

## Summary

- Partition to minimize cut size
- Additional constraints to do well
  - Improving constant factors
- Quadrisection
- Keep track of estimated placement
- Relax/iterate/Refine

## Big Ideas:

- Potential dominance of interconnect
- Divide-and-conquer
- Successive Refinement
- Phase ordering: estimate/relax/iterate

## Admin

- Assignment 3 out
- No Office Hours Tuesday
- No class Wednesday
- Reading for next Monday
  - Online (JSTOR): classic paper on Simulated Annealing
- Drop Day is Friday
  - ...I will try to make some grading progress while I travel...
